Features and benefits

WDH-SB4:

Water-cooled liquid chillers for cooling tower and dry cooler applications, range 573-1500 kW

Indoor unit for the production of chilled water with semi-hermetic screw compressors optimized for working with low compression ratios, condenser and evaporator tube bundle, electronic expansion valve, R-134a refrigerant.

Energy efficiency

The WDH-SB4 series offers high-efficiency performance with both full and partial load, guaranteeing minimum operating costs and a quick return on investment:

- EER of up to 5,48
- SEER up to 6,53 which makes it compliant with Directive ERP 2021

Installation flexibility

Compact design that allows greater flexibility during installation both for new and existing systems and greater ease of handling and positioning in small spaces.

Adaptability

Maximum adaptability to the needs of the system:

- Minimum capacity modulation up to 25%
- Three versions available: cooling only operation, operation with water circuit change-over, heating only operation at high temperature
- Energy-saving solutions thanks to partial or total heat recovery
- Ideal for industrial applications, thanks to the production of chilled water up to -8°C (BRINE option)
- Extended operating range
- Two levels of silence: Standard and Super Silenced

Reliability

The WDH-SB4 series is made with:

- Two independent refrigerating circuits that guarantee continuous operation
- Double-screw compressors with long-life bearings, gradual star-delta or part-winding start-up, oil separator that guarantees correct lubrication in all operating conditions, non-return valve that prevents counter-rotation and wear of the screw
- Evaporator with double antifreeze protection: temperature probes and differential pressure switch

Standard unit specifications

Compressor

Compact semi-hermetic compressor with double helical screw: the main rotor (male, with five lobes) is directly driven by the electric motor, while the secondary rotor (female, with six vanes) is driven by the primary rotor. Continuous modulation of the dispensed cooling capacity, with no-load start-up. Tightness is guaranteed by precisely fitting clearances in the mechanical processing of all moving parts and by a special system of oil circulation between the rotors. Spontaneous-circulation lubrication system through pressure difference, coupled with a high-efficiency separator, level indicator and oil filter (replaceable). Oil heater with electric element for preventing excessive dilution of the refrigerant, automatically inserted in all phases during which the compressor is turned off.

Three-phase asynchronous motor with two poles, cooled by the extracted gas, with star/delta reduced-load start-up. Integrated electronic protection module with discharge temperature safety sensor, maximum temperature sensors for windings, motor rotation sensor and phase monitoring device. Cut-off valve on refrigerant discharge line. Filter on suction line at compressor input point. Integrated silencer and non-return valve on compressor discharge outlet. Automatic safety valve inside compressor between high (HP) and low (LP) pressure areas.

Structure

Structure and base made entirely of sturdy sheet steel, thickness of 30/10 or 40/10, with the surface treatment in Zinc-Magnesium painted, for the parts in view, with polyester powder RAL 9001 that guarantees excellent mechanical characteristics and high corrosion strength over time.

Evaporator

Direct expansion exchanger with refrigerant side independent circuit for each compressor. The exchanger is composed of a cover made of carbon steel. The tubes, anchored to the tube plate by mechanical expansion, are made of copper, high efficiency, internally rifled to improve thermal exchange and specially designed for use with modern ecological refrigerants. It also includes a water side protection differential switch, an anti-freeze heating element to protect against icing, and covering in closed-cell thermo-insulating material that prevents the formation of condensation and heat exchange with the exterior.

The water connections of the exchanger are quick-release with splined joint.

Condenser

Direct expansion shell and tube evaporator (refrigerant on jacket side and water inside pipes). Carbon-steel jacket with high-efficiency copper pipes fully threaded to optimise the exchange of heat and anchored mechanically to a pipe plate by mandrel, specially designed for use with modern environmentally friendly refrigerants. Removable heads to enable cleaning and maintenance on the exchanger. Max. exchanger operating pressure water side: 10 bar. Quick-fit plumbing connections with grooved joint.

Refrigeration circuit

Two independent refrigeration circuits made of copper, brazed and factory-assembled, complete with:

- anti-acid dehydrator filter with solid cartridge complete with quick-fit connector for refrigerant;
- high-pressure safety pressure switch;
- low pressure transducer;
- refrigerant temperature probe
- electronic expansion valve;
- high and low pressure gauges;
- high pressure safety valve (safety valve with sealed tap open for inspection);
- low pressure safety valve (safety valve with sealed tap open for inspection);
- liquid flow and humidity indicator;
- cut-off valve on compressor supply circuit;
- cut-off valve on liquid line.

Suction pipes thermally insulated with highly flexible EPDM rubber closed-cell elastomer insulation. Each cooling circuit is tested under pressure for leaks and is supplied complete with load of refrigerant gas.

Electrical panel

Entirely manufactured and wired in conformity to the EN 60204 standard. The power section includes:

- door locking main circuit breaker;
 - main power supply terminals (400 V/3 Ph/50 Hz);
 - insulation transformer for powering the auxiliary circuit (230 V/24 V);
 - fuses and thermal relays for protecting the compressors;
 - compressor control contactor;
- The control section includes:
- interface terminal with graphic display;
 - set values, error codes and parameters can be displayed;
 - proportional-integral-derivative adjustment of water temperature;
 - management of unit start-up from local or remote device;
 - ON/OFF keys and alarm reset;
 - daily, weekly temperature set point and start-up/shutdown scheduler;
 - anti-freeze protection water side;
 - compressor protection and timer;
 - pre-alarm function for water anti-frost and refrigerant gas high pressure functions;
 - self-diagnosis system with instant error code visualisation;
 - control of compressor start-up automatic rotation;
 - visualisation of no. of hours of compressor operation;
 - remote ON/OFF control;
 - remote relay to signal cumulative alarms;
 - demand limit input (absorbed power limit depending on external signal 0÷10V or 4÷20 mA);
 - potential-free contacts for compressor status;
 - digital input to enable double set point;
 - multifunctional phase monitor;
 - refrigerant gas high pressure pre-alarm function (prevents automatic unit shutdown in many cases);
 - remote HEAT/COOL command.

All device functions can be replicated with a normal laptop computer connected to the unit via an Ethernet cable and with a browser. All electrical cables are coloured and numbered according to the wiring diagram.

Accessories

- Rubber antivibration mounts (separately supplied accessories)
- Progressive compressor start-up device
- Compressor overload circuit breakers
- Power factor correction capacitors ($\cos\phi > 0.9$)
- Energy meter
- Set-point compensation with outdoor air temperature probe
- Set-point compensation with signal 0-10 V
- Set-point compensation with signal 4-20 mA
- BACnet/IP serial communication module
- LonWorks serial communication module
- Modbus serial communication module
- Remote microprocessor control unit (separately supplied accessories)
- Mains power supply unit (accessory separately supplied)
- ECOSHARE function
- Modulating valve source side (accessory separately supplied)
- Switching valve with dual safety valves
- Refrigerant leak detector
- High and low pressure gauges
- Steel mesh strainer

Test

Unit subjected to factory-tested in specific steps and test pressure of the piping of the refrigerant circuit (with nitrogen and hydrogen), before shipping them. After the approval, the moisture contents present in all circuits are analyzed, in order to ensure the respect of the limits set by the manufacturers of the different components.

Unit configuration

| | | | | | | | |
|----------------|----------------|------------|------------|-----------|----------|----------|----------|
| WDH-SB4 | 220 . 2 | EXC | OCO | ST | T | - | - |
| (1) | (2) (3) | (4) | (5) | (6) | (7) | (8) | (9) |

(1) Range

WDH = Water cooled liquid chiller with screw compressors
SB4 = SCREWLine⁴ Range

(2) Size

220 = Nominal compressor capacity (HP)

(3) Compressors

.2 = Compressors

(4) Energy version

EXC = EXCELLENCE version: high energy efficiency

(5) Operation

OCO = Cooling only operation (standard)
OHI = Operation with water circuit change-over
OHO = Heating only operation

(6) Acoustic configuration

ST = Standard acoustic configuration (standard)
EN = Super-silenced acoustic configuration

(7) Condenser

CO1OP = 1 pass condenser with opposit water connection
CO2P = 2 pass condenser

(8) Energy recovery

(-) = Energy recovery: not required (standard)
D = Partial energy recovery (6% off condensing heat)
R = Total energy recovery (100% off condensing heat)

(9) Low evaporator water temperature

(-) = Low water temperature: not required (standard)
B = Low water temperature, down to -8°C (Brine)

PFCP**Power-factor correction capacitors (cosfi >0.9)**

The component is necessary to lower the phase difference between current and voltage in the electromagnetic components of the unit (e.g. asynchronous motors). The component allows to put the cosfi power factor to values on average higher than 0.90, reducing the network reactive power. This often leads to an economic benefit which the energy provider grants to the final user. The device is installed and wired built-in the unit.

CMSC9**Serial communication module for Modbus supervisor**

This enables the serial connection of the supervision system, using Modbus as the communication protocol. It enables access to the complete list of operational variables, commands and alarms. Using this accessory every unit can dialogue with the main supervision systems.

The device is installed and wired built-in the unit.

- ⚠ The total length of each serial line do not exceed 1000 meters and the line must be connected in bus typology (in/out)

CMSC10**Serial communication module for LonWorks supervisor**

This enables the serial connection of the supervision system which uses the LonWorks communication protocol. It enables access to a list of operating variables, commands and alarms which comply with the Echelon® standard.

The device is installed and wired built-in the unit.

- ⚠ The configuration and management activities for the LonWorks networks are the responsibility of the client.
- ⚠ LonWorks technology uses the LonTalk® protocol for communicating between the network nodes. Contact the service supplier for further information.
- ⚠ The total length of each serial line do not exceed 1000 meters and the line must be connected in bus typology (in/out)

CMSC11**Serial communication module for BACnet-IP supervisor**

Allows the serial connection to supervision systems by using BACnet-IP as a communication protocol. It allows the access to the entire list of operating variables, controls and alarms. With this accessory every unit can communicate with the main supervision systems.

The device is installed and wired built-in the unit.

- ⚠ The configuration and management activities for the BACnet networks are the responsibility of the client.
- ⚠ The total length of each serial line do not exceed 1000 meters and the line must be connected in bus typology (in/out)

ECS**ECOSHARE function for the automatic management of a group of units**

The device allows automatic management of units that operate on the same hydraulic circuit, by creating a local communication network.

There are two control modes that can be set via a parameter during the activation stage. They both distribute the heat load on the available units by following the distribution logic to benefit from efficiency levels at part load.

Moreover:

Mode 1 - it keeps all the pumps active

Mode 2 - it activates only the pumps of the unit required to operate

The device allows for rotation based on the criterion of minimum wear and management of units in stand-by. There are various unit sizes. Every unit must be fitted with the ECOSHARE feature. The set of units is controlled by a Master unit.

The local network can be extended up to 7 units (1 Master and 6 Slave).

- ⚠ The unit supplied with this device can also be equipped at the same time with the RCMRX option and one of the CMSC9 / CMSC10 / CMSC11 options.

CBS**Overload circuit breakers**

The magnetothermic circuit breakers are inserted instead of the fuses for the protection against the short circuit and overload. In case of intervention they do not have to be replaced, as it happens with fuses.

SFSTR2**Progressive compressor start-up device**

This option is also called ‘Soft starter’. Electronic device that automatically and gradually starts the compressors, thereby reducing the current peak generated in star-triangle start-ups and therefore reduces the mechanical stress on the motor and the electrodynamic stress on the power cables and on the mains.

The device is installed and wired built-in the unit.

- ⚠ Check availability and compatibility of ‘SFSTR2 - Progressive compressor start-up device’ with the other accessories in the “Option compatibility” table.

Built-in options

CONTA2

Energy meter

Allows to display and record the unit's main electrical parameters. The data can be displayed with the user interface on the unit or via the supervisor through the specific protocol variables.

It is possible to control:

- voltage (V),
- absorbed current (A),
- frequency (Hz),
- cosfi,
- power input (kW),
- absorbed energy (kWh),
- harmonic components (%).

The device is installed and wired built-in the unit.

 Only the following parameters are available on the LonWorks protocol: power input (kW) and absorbed energy (kWh).

SCP4

Set-point compensation with 0-10 V signal

This device enables the set-point to be varied which is pre-set using an external 0-10 V signal.

The device is installed and wired built-in the unit.

SPC1

Set-point compensation with 4-20mA signal

This device enables the set-point to be varied which is pre-set using an external 4-20mA signal.

The device is installed and wired built-in the unit.

SPC2

Set-point compensation with outdoor air temperature probe

This device enables the set-point to be varied automatically which is pre-set depending on the outdoor air temperature. This device enables the liquid flow temperature to be obtained, which varies depending on external conditions, enabling energy savings throughout the entire system.

The device is installed and wired built-in the unit.

 The device includes a probe controlled remotely from outside to measure the outdoor air temperature. (Installation to be carried out by the customer). The connection cable length is 16 m.

RDVS

Switching valve with dual safety valves

Allows maintenance or replacement of the safety valve without draining the unit. Two pressure relief valves (each valve is sized according to 13136 clause 6.2) connected via a changeover valve are provided.

RPR

Refrigerant leak detector

Leak detector device built-in installed and placed inside the compressor box, it detects leaks of the internal refrigeration circuit.

MHP

High and low pressure gauges

It includes two liquid pressure gauges for the analog measurement of refrigerant pressures on suction and discharge lines of the compressors with pressure sockets installed in the unit in an easily accessible location.

The accessory is built-in the unit.

Accessories separately supplied

IVMSX

Modulating valve source side

Recommended option in applications with disposable water with relatively low temperatures (well, groundwater, water mains). The two-way modulating motorised valve is located on the thermal source side and is controlled by the unit. It operates in conjunction with the refrigeration circuit: the modulation via the 0-10V signal - based on the pressure of the refrigerant in the exchanger on the source side - reduces water consumption and ensures the units stays in the expected operating range.

Unit in "OCO - Cold only" configuration

The kit includes two valves, one for each circuit.

The two-way valves are three-way type with a closed way.

They can also be used as three-way, by removing the cap closure

Unit in "OHI - Operation with water circuit change-over" configuration

The kit consists of a single valve managed by the unit according to the operating pressures of both circuits.

For sizes 220.2-240.2, three-way valves with one closed port are used, for the other sizes two-way valves are used.

The valves, if not supplied by CLIVET, must have a fast stroke actuator, with an actuation times of 35 sec.

⚠ Warning: to allow for correct opening and closure the differential pressure value must be at least 200 kPa.

⚠ Option to be installed outside the unit on the water outlet pipe on the source side. The Customer is responsible for conducting the hydraulic and electrical connection. The Customer is responsible for the 230V AC power supply.

⚠ Option not compatible with sea water. In these cases fit an intermediate exchanger outside the unit.

RCMRX

Remote control via microprocessor remote control

This option allows to have full control over all the unit functions from a remote position.

It can be easily installed on the wall and has the same aspect and functions of the user interface on the unit.

- ⚠ All device functions can be repeated with a normal portable PC connected to the unit with an Ethernet cable and equipped with an internet navigation browser.**
- ⚠ The device must be installed on the wall with suitable plugs and connected to the unit (installation and wiring to be conducted by the Customer).** Maximum remote control distance 350 m without auxiliary power supply. For distances greater than 350 m and in any case less than 700 m it is necessary to install the 'PSX - Mains power unit' accessory.
- ⚠ Data and power supply serial connection cable n.1 twisted and shielded pair. Diameter of the individual conductor 0.8 mm.**

PSX

Mains power supply unit

The device allows the unit and the remote control to communicate with the user interface even when the serial line is longer than 350 m.

It must be connected to the serial line at a distance of 350 m from the unit and allows to extend the length to 700 m maximum in total. The device requires an external power supply at 230V AC.

⚠ Power supply at 230V AC provided by Customer.

⚠ Installation is a responsibility of the Customer.

AMRX

Rubber antivibration mounts

Mat in thermoplastic elastomer composed of 4 inner layers. Hardness 45 ShA, thickness 37.5 mm.

Thermoplastic Elastomer is ideal for temperature range -45° C to 110° C.

It has a high resistance to aging, pollutants, hydrocarbons, saline mists, UV rays and detergents and is composed of recyclable material.

High degree of thermal and electrical insulation.

IFWX

Steel mesh strainer on the water side

The device stops the exchanger from being clogged by any impurities which are in the hydraulic circuit. The mechanical steel mesh strainer must be placed on the water input line. It can be easily dismantled for periodical maintenance and cleaning. It also includes:

- cast-iron shut-off butterfly valve with quick connections and activation lever with a mechanical calibration lock;
- quick connections with insulated casing.

⚠ Installation is the responsibility of the Client, externally to the unit.

⚠ Check for the presence of the required hydraulic shut-off valves in the system, in order to undertake periodical maintenance.

Configurations

OCO - Cooling only operation (Standard)

Configuration that allows the water - water unit to operate with the thermoregulation active when chilled water is produced at a controlled temperature.

OHO - Heating only operation

Configuration that allows operation as water-water heat pump to produce hot water for civil and industrial use.

OHI - Operation with water circuit change-over

Configuration that allows operation as water-water heat pump to produce hot water for civil and industrial use.

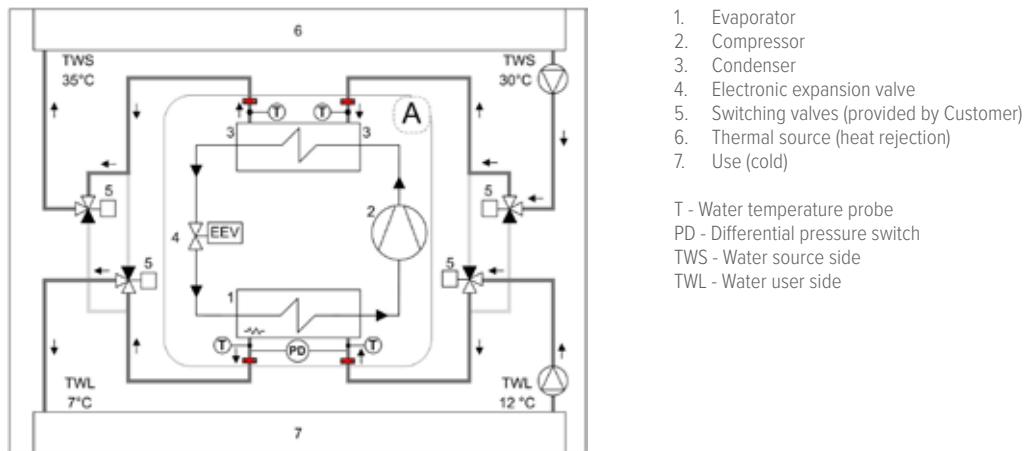

It consists of:

- suitable exchangers with extra-thick closed-cell insulation
- temperature probes at the exchanger's water inlet and outlet.

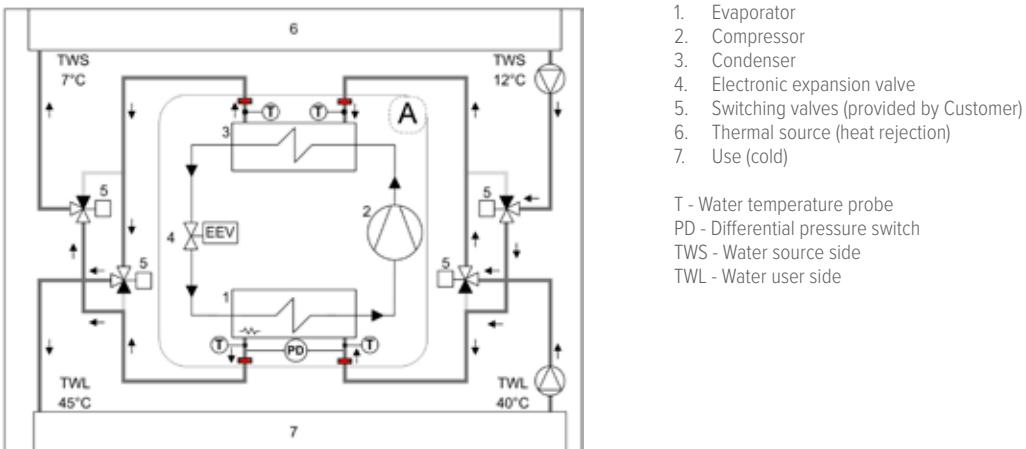

The system must be fitted with switching valves. The hydraulic switching must be carried out when the unit's operating mode is changed. In summer operation mode, the unit automatically controls the evaporation temperature based on the selected set-point value. Likewise, in winter operation mode, the unit automatically adjusts the condensation temperature based on the selected set-point value and checks the temperature on the evaporator to prevent the water from freezing.

- ⚠ The Customer is responsible for installing and managing the hydraulic switching valve
- ⚠ The Customer can change the operating mode using the interface on board the machine or the designated potential-free contact.
- ⚠ Possible non-freeze solutions must be fitted both on the utilisation circuit and the source circuit, as hydraulic switching involves mixing fluids.
- ⚠ During operation with Dry coolers or Evaporative towers, the temperatures of the fluid on the source side need to be always positive as there is no defrosting function.
- ⚠ The device includes two temperature probes to be positioned at the input and output of the connection manifold between the two condensers. The manifolds and the probe installation are provided by the Customer. The connection cable length is 3m.

Operation mode: cooling

Operation mode: heating

EN - Super-silenced acoustic configuration

Configuration used to increase the unit's silent operation by acting on the source of the noise. It consists of suitable steel casings lined with high-density material designed to provide sound insulation. Equipped with sound-proof cover coating which envelop the compressors.

⚠ To assess the quality of the soundproofing benefit, refer to the 'Sound levels' tables.

B - Water low temperature (Brine)

Configuration also known as "Brine". Enables an "unfreezable" solution to be cooled (for example, water and ethylene glycol in suitable quantities) up to a temperature of between +4°C and –8°C.

It includes:

- suitable exchangers with extra-thick closed-cell insulation
- electronic expansion valve, functional calibration and safety devices suitable for particular uses.

⚠ During the selection phase it is necessary to indicate the required operating type, the unit will be optimised on the basis of this: - Unit with single operating set-point (only at low temperature) - Unit with double operating set-point

⚠ The unit in this configuration has a different operating field, which was reported in the previous pages.

⚠ In low temperature operation, some staging steps could not be available.

⚠ The glycol concentration must be chosen based on the minimum temperature the water can reach. The presence of glycol influences pressure drops on the water side and the unit's output as indicated in the table reporting the "correction factors for use with glycol".

Correction factor for water low temperature

| | 2 | 0 | -2 | -4 |
|-------------------------------|-------|-------|-------|-------|
| Cooling capacity factor | 0.860 | 0.803 | 0.749 | 0.691 |
| Compressor power input factor | 0.896 | 0.878 | 0.859 | 0.840 |

⚠ The correction coefficients must be applied to condition: internal exchanger water (evaporator) = 12 / 7 °C.

CO1OP - 1 pass condenser with opposit water connection

This is the configuration in which the unit is sized to operate with a rated temperature differential of 5°C on the source side exchanger (condenser) and therefore, with water flow-rates typical of cooling towers and evaporative coolers.

⚠ In 'OHI - Operation with reversability on the water circuit' mode and source water temperature relatively low provide the 'IVMSX - Modulating valve source side' accessory.

CO2P - 2 pass condenser

This is the configuration in which the unit is sized to operate with an high temperature differential (usually DT = 15°C) on the source side exchanger (condenser) and therefore, with reduced water flow-rates typical of the disposable water applications (well, ground water or water mains). It consists of a source side exchanger where the water passes through a number of times before being released to the source.

⚠ Option not compatible with 'OHI - Operation with water circuit change-over'.

⚠ In the 'OHI = Operation with water circuit change-over' mode and relatively low source water temperatures (well, groundwater, water mains), configure the unit with the 'IVMSX - Source side modulating valve' accessory together with the standard configuration, "CO1OP - 1 pass condenser with opposit water connection".

Configurations

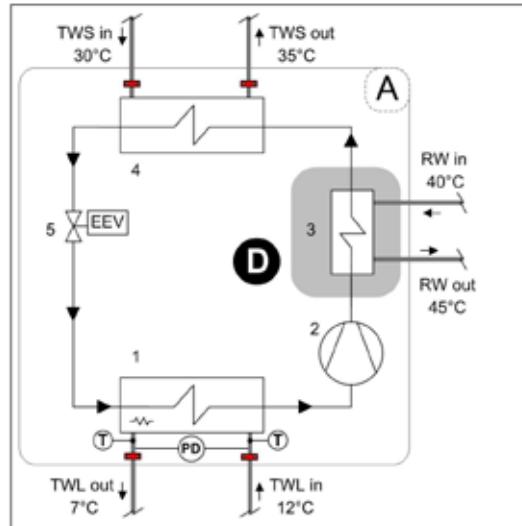

D - Partial energy recovery

A configuration which enables the production of hot water free-of-charge while operating in the cooling mode, thanks to the partial recovery of condensation heat that would otherwise be disposed of into the external heat source.

This option is also called 'desuperheater'. It consists of shell and tube heat exchangers, suitable to recover part of the unit heating capacity (equal to the sum of the cooling capacity and the capacity absorbed by the compressors).

The partial recovery device is considered to be operating when it is powered by the water flow which is to be heated. This condition improves the unit performance, since it reduces the condensation temperature: in nominal conditions the cooling capacity increases indicatively by 3.2% and the power input of the compressors is reduced by 3.6%.

When the temperature of the water to be heated is particularly low, it is wise to insert a flow control valve into the system hydraulic circuit, in order to maintain the temperature at the recovery output at above 35°C and thus avoid the condensation of the refrigerant into the partial energy recovery device.

D - Partial recovery device

A - Unit supply limit

1 - Evaporator

2 - Compressor

3 - Recovery exchanger

4 - Condenser

5 - Expansion electronic valve

TWS in - Condenser water inlet

TWS out - Condenser water outlet

TWL in - Evaporator water inlet

TWL out - Evaporator water outlet

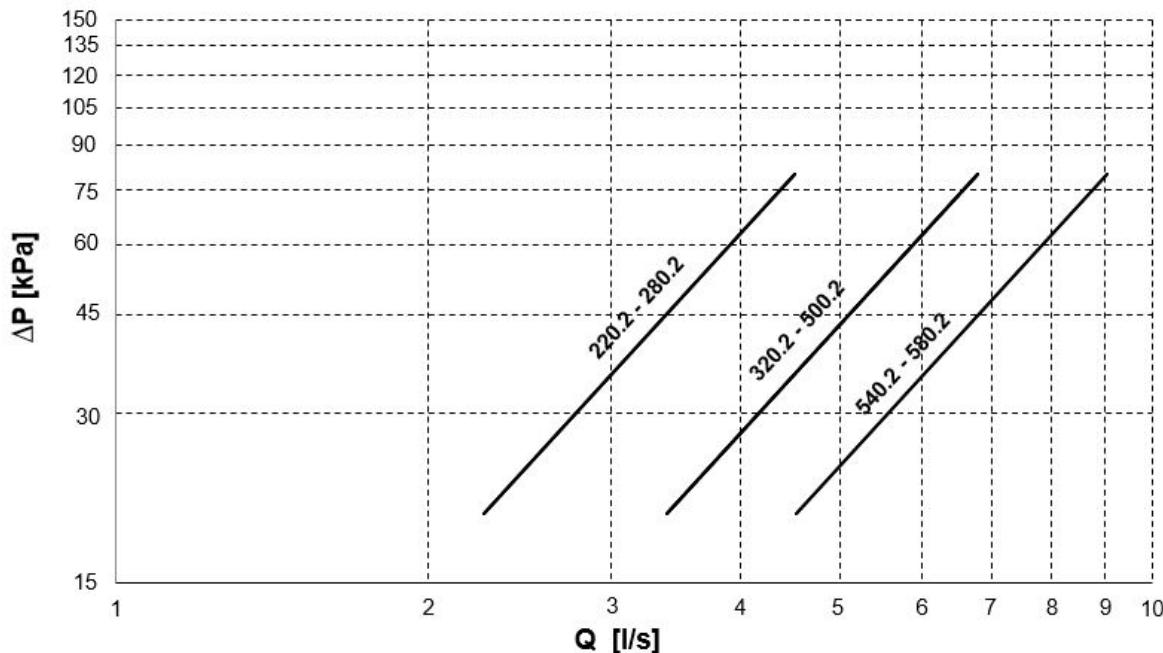

RW in - Recovery water inlet

RW out - Recovery water outlet

T - Temperature probe

PD - Differential pressure switch

Pressure drops of partial energy recovery exchanger

Q = Water flow rate (l/s)

DP = Water side pressure drops (kPa)

⚠ The maximum capacity available from the partial recovery is equal to the 5% of the rejected heating capacity (cooling capacity + compressor power input)

Admissible water flow rates

Min. (Qmin) and max. (Qmax) water flow-rates admissibles for the correct unit operation.

| SIZE | 220.2 | 240.2 | 280.2 | 320.2 | 360.2 | 440.2 | 500.2 | 540.2 | 580.2 |
|------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Qmin [l/s] | 2,3 | 2,3 | 2,3 | 3,4 | 3,4 | 3,4 | 3,4 | 4,5 | 4,5 |
| Qmax [l/s] | 4,5 | 4,5 | 4,5 | 6,8 | 6,8 | 6,8 | 6,8 | 9,0 | 9,0 |

R - Total energy recovery

Configuration that allows to produce free hot water during the cooling operation, thanks to the total condensation heat recovery of all that would otherwise be disposed of on the external thermal source. This solution increases the system's overall efficiency in all cases where large amounts of hot water need to be generated.

It consists of shell and tube exchangers suitable to recover all the heating capacity of the unit (equal to the sum of the cooling capacity and the electrical power absorbed by the compressors).

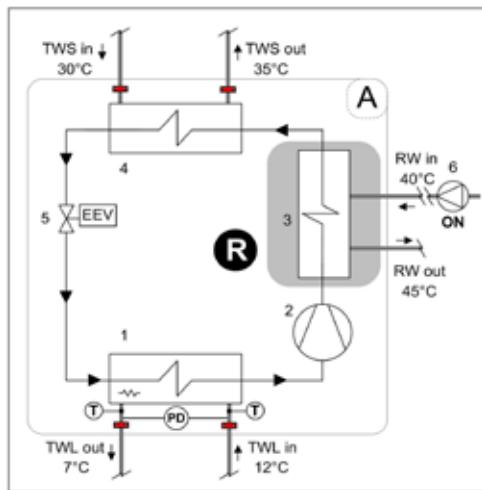

Hot water availability is always subordinate to the production of chilled water.

See the following example:

1. cooling capacity request = 100% / Heating capacity request = 0% >Production only of cooling capacity;
2. cooling capacity request = 100% / Heating capacity request = 0% >Production of cooling and heating capacity by recovery;
3. cooling capacity request = 50% / Heating capacity request = 100% >Production of cooling and heating capacity by recovery, equal to the 50% of the requested heating capacity.

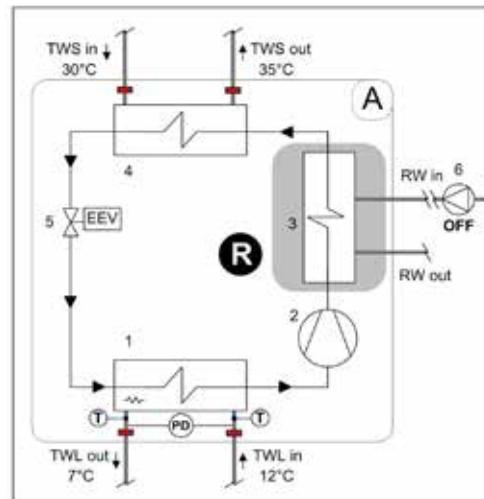

TOTAL ENERGY RECOVERY IN OPERATION

The pump on the recovery exchanger must be activated when hot water is required. Condensation takes place entirely in the recovery circuit.

TOTAL ENERGY RECOVERY NOT IN OPERATION

The pump on the recovery exchanger must be deactivated when hot water is required.

R - Total recovery device

- A - Unit supply limit
- 1- Evaporator
- 2 - Compressor
- 3 - Recovery exchanger
- 4 - Condenser
- 5 - Expansion electronic valve
- 6 - Recovery side pump (supply and management by the customer)

TWS in - Condenser water inlet

TWS out - Condenser water outlet

TWL in - Evaporator water inlet

TWL out - Evaporator water outlet

RW in - Recovery water inlet

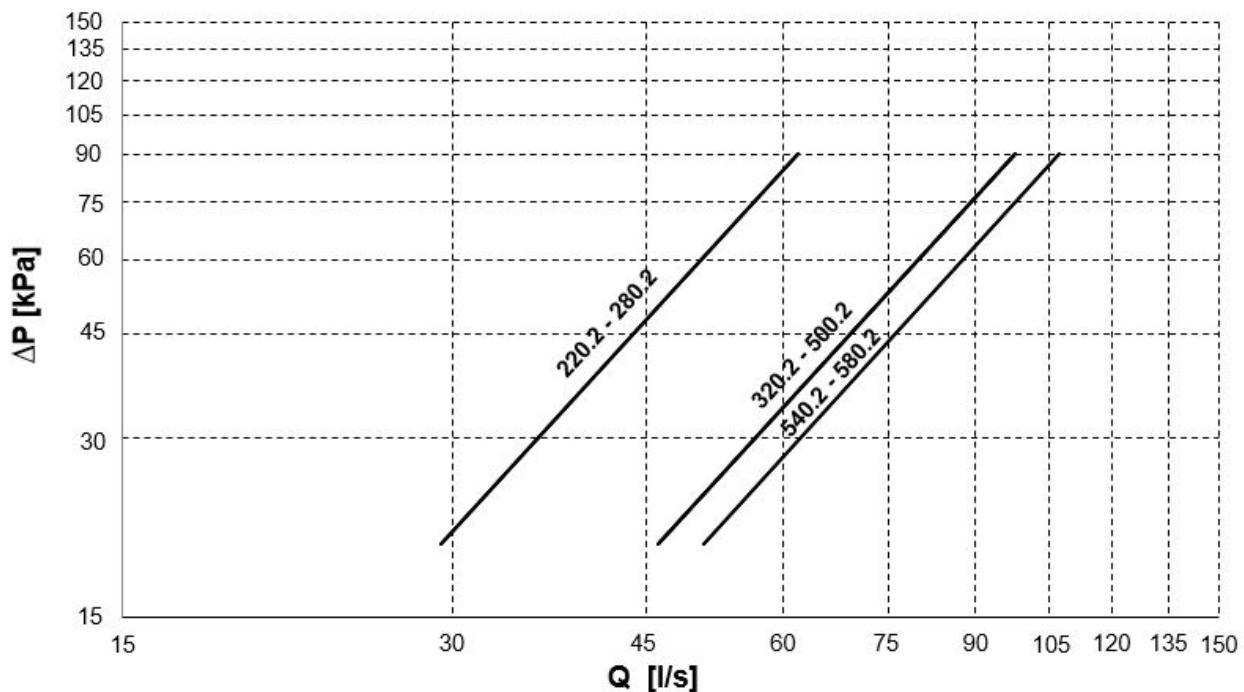

RW out - Recovery water outlet

T - Temperature probe

PD - Differential pressure switch

Configurations

Pressure drops of the total energy recovery exchanger

Q = Water flow rate (l/s)

DP = Water side pressure drops (kPa)

⚠ The return exchanger outlet water has the same temperature limits shown in the operating range of the standard unit under this entry: "TWS (°C) = external exchanger leaving water temperature (condenser)".

Admissible water flow rates

Min. (Qmin) and max. (Qmax) water flow-rates admissibles for the correct unit operation.

The Product is compliant with the Erp (Energy Related Products) European Directive. It includes the Commission delegated Regulation (EU) No 2016/2281, also known as Ecodesign LOT21 «It contains fluorinated greenhouse gases» (GWP 1430)

1. Data referred to the following conditions: Evaporator water temperature = 12/7 °C. Condenser water temperature = 30/35 °C. Evaporator fouling factor = $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$
2. The Total Power Input value does not take into account the part related to the pumps and required to overcome the pressure drops for the circulation of the solution inside the exchangers.
3. Option. Recovery exchanger water temperature = 40/45°C.
4. Data calculated in conformity to the EN 14511:2018 referred to the following conditions: Evaporator water temperature = 12/7°C. Condenser water temperature = 30/35°C.
5. Data compliant to Standard AHRI 551/591 referred to the following conditions: Evaporator water tempearture = 12/7°C. Water flow rate 0,043 l/s per kW. Condenser water temperature = 30/35°C. Evaporator fouling factor $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$
6. Data referred to the following conditions: Condenser water temperature = 40/45°C. Evaporator water temperature = 12/7°C. Evaporator fouling factor $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$
7. Data calculated in conformity to the EN 14511:2018 referred to the following conditions: Condenser water temperature = 40/45°C. Evaporator water temperature = 12/7°C.
8. Data calculated in compliance with Standard EN 14825:2016

- DSW = Double-screw compressors
- The unit is able to modulate STEPLESS continuously. The following data refers to a continuous operation of the unit.
- Indicative values for standard units with possible variation +/- 10%. Actual data are shown on the unit's matricular label.
- S&T = Shell and tube
- The calculated water volume to the system does not consider the volume of water contained in the internal exchanger. With applications at low outdoor air temperature or low average loads requested, the minimum water volume to the system is obtained by increasing the indicated value by 40%.

Sound levels refer to full load units, in test nominal conditions. The sound pressure level refers to 1 m. from the unit outer surface operating in open field.
Measurements are carried out in compliance with UNI EN ISO 9614-1

The sound power data is not certified by Eurovent.

Data referred to the following conditions: internal exchanger water = 12/7°C; external exchanger water = 30/35°C.

General technical data

Operating range - OCO - OHI Version

1. Standard unit
2. Operation range extension for unit in 'Low water temperature (Brine)' configuration
3. Operating range with automatic staging of the compressor capacity.

To ($^\circ C$) = Evaporator outlet water temperature

T_{ws} ($^\circ C$) = Condenser outlet water temperature

- DSW = Double-screw compressors
- The unit is able to modulate STEPLESS continuously. The following data refers to a continuous operation of the unit.
- Indicative values for standard units with possible variation +/- 10%. Actual data are shown on the unit's matricular label.
- S&T = Shell and tube
- The calculated water volume to the system does not consider the volume of water contained in the internal exchanger. With applications at low outdoor air temperature or low average loads requested, the minimum water volume to the system is obtained by increasing the indicated value by 40%.

Sound levels refer to full load units, in test nominal conditions. The sound pressure level refers to 1 m. from the unit outer surface operating in open field. Measurements are carried out according to the UNI EN ISO 9614-2 standard, in compliance with the EUROVENT 8/1 certification. Data referred to the following conditions: internal exchanger water = 12/7°C; external exchanger water = 30/35°C.

General technical data

Operating range - OHO Version

1. Standard unit
2. Operation range extension for unit in 'Low water temperature (Brine)' configuration
3. Operating range with automatic staging of the compressor capacity.

To (°C) = Evaporator outlet water temperature

T_{ws} (°C) = Condenser outlet water temperature

General technical data

Evaporator pressure drops

The pressure drops are calculated considering a water temperature of 7°C

Q = Water flow rate [l/s]

DP = Water side pressure drops [kPa]

The water flow rate must be calculated with the following formula

$$Q \text{ [l/s]} = kWt / (4,186 \times DT)$$

kWt = Heating capacity in kW

DT = Temperature difference between inlet / outlet water

Admissible water flow rates

Min. (Qmin) and max. (Qmax) water flow-rates admissibles for the correct unit operation.

| SIZE | 220.2 | 240.2 | 280.2 | 320.2 | 360.2 | 440.2 | 500.2 | 540.2 | 580.2 |
|------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Qmin | [l/s] | 19,0 | 19,0 | 21,4 | 28,2 | 28,2 | 28,7 | 37,5 | 55,6 |
| Qmax | [l/s] | 47,2 | 47,2 | 59,2 | 70,0 | 70,0 | 76,7 | 95,0 | 127,2 |

Minimum system water content

For a proper functioning of the unit a minimum water content has to be provided to the system, using the formula:

Minimum water content [l] = $10 \times kWf$ (air conditioning application)

= $14 \times kWf$ (application with low outdoor temperature or low loads required)

kWf = Nominal cooling capacity unit

⚠ Volume calculated does not consider internal heat exchanger (evaporator) water content.

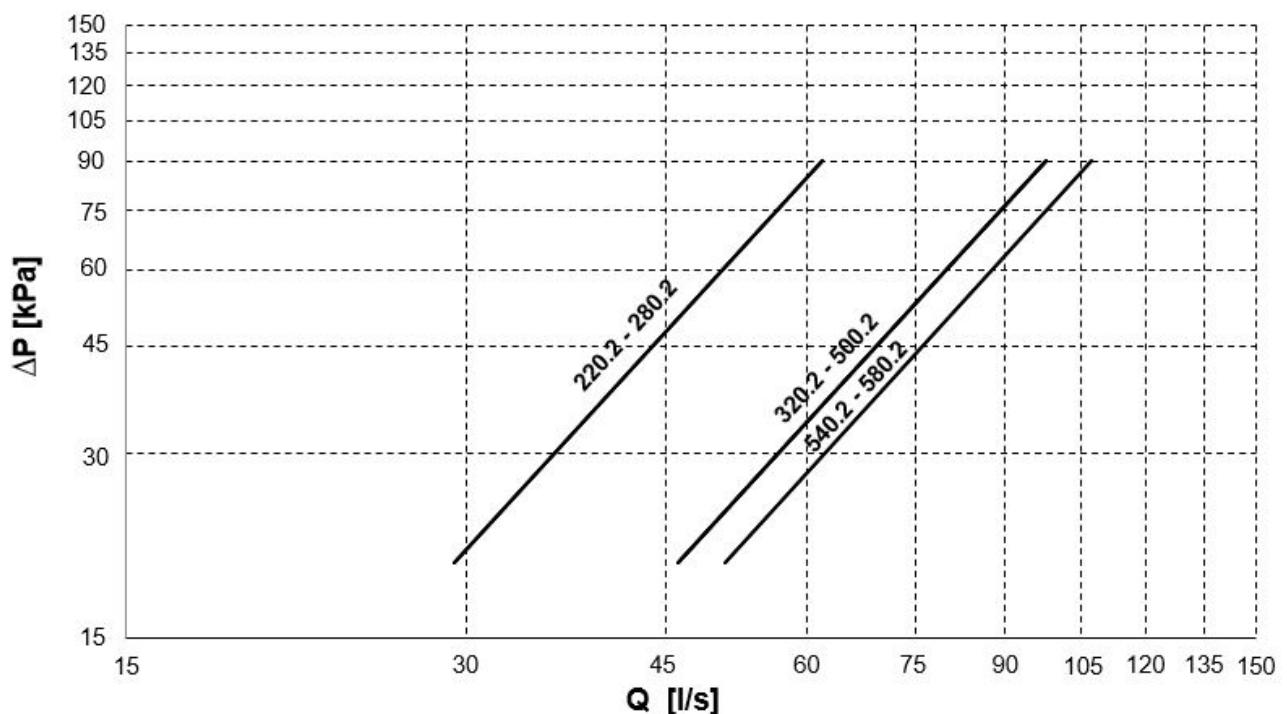

Exchanger operating range

| | Internal exchanger | | External exchanger | |
|----------|----------------------------|------|--------------------|------|
| | DPr (500.2-540.2-580.2) | DPw | DPr | DPw |
| PED (CE) | 1650 (1600) | 1050 | 2500 | 1600 |

DPr = Max. operating pressure refrigerant gas side

DPw = Max. operating pressure water side (utility)

1 pass condenser pressure drops

The pressure drops are calculated considering a water temperature of 7°C

Q = Water flow rate [l/s]

DP = Water side pressure drops [kPa]

The water flow rate must be calculated with the following formula

$$Q \text{ [l/s]} = kWt / (4,186 \times DT)$$

kWt = Heating capacity in kW

DT = Temperature difference between inlet / outlet water

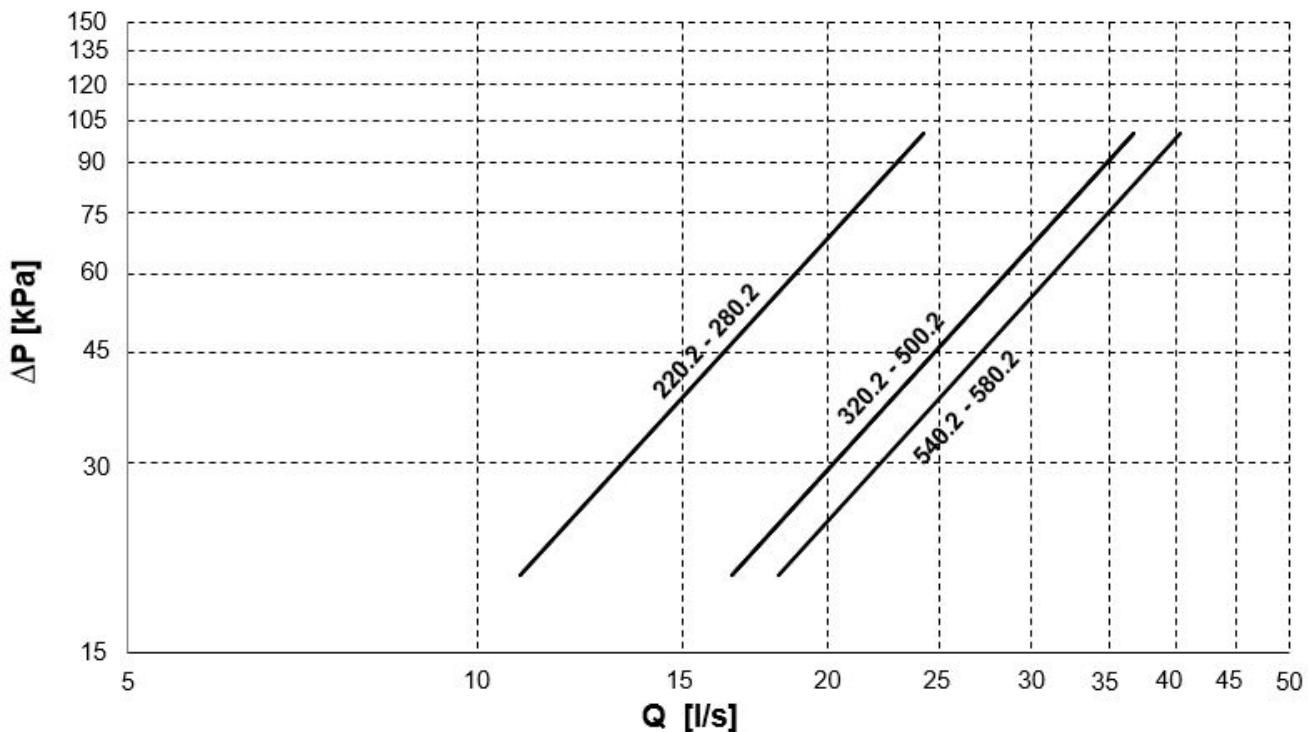

Admissible water flow rates

Min. (Qmin) and max. (Qmax) water flow-rates admissibles for the correct unit operation.

To (°C) = Evaporator outlet water temperature

kWf = Cooling capacity [kW]

kWe = Electrical power absorbed by compressors [kW]

kWt = Heating capacity [kW]

Water temperature differential = 5°C

Performances

To (°C) = Evaporator outlet water temperature

kWf = Cooling capacity [kW]

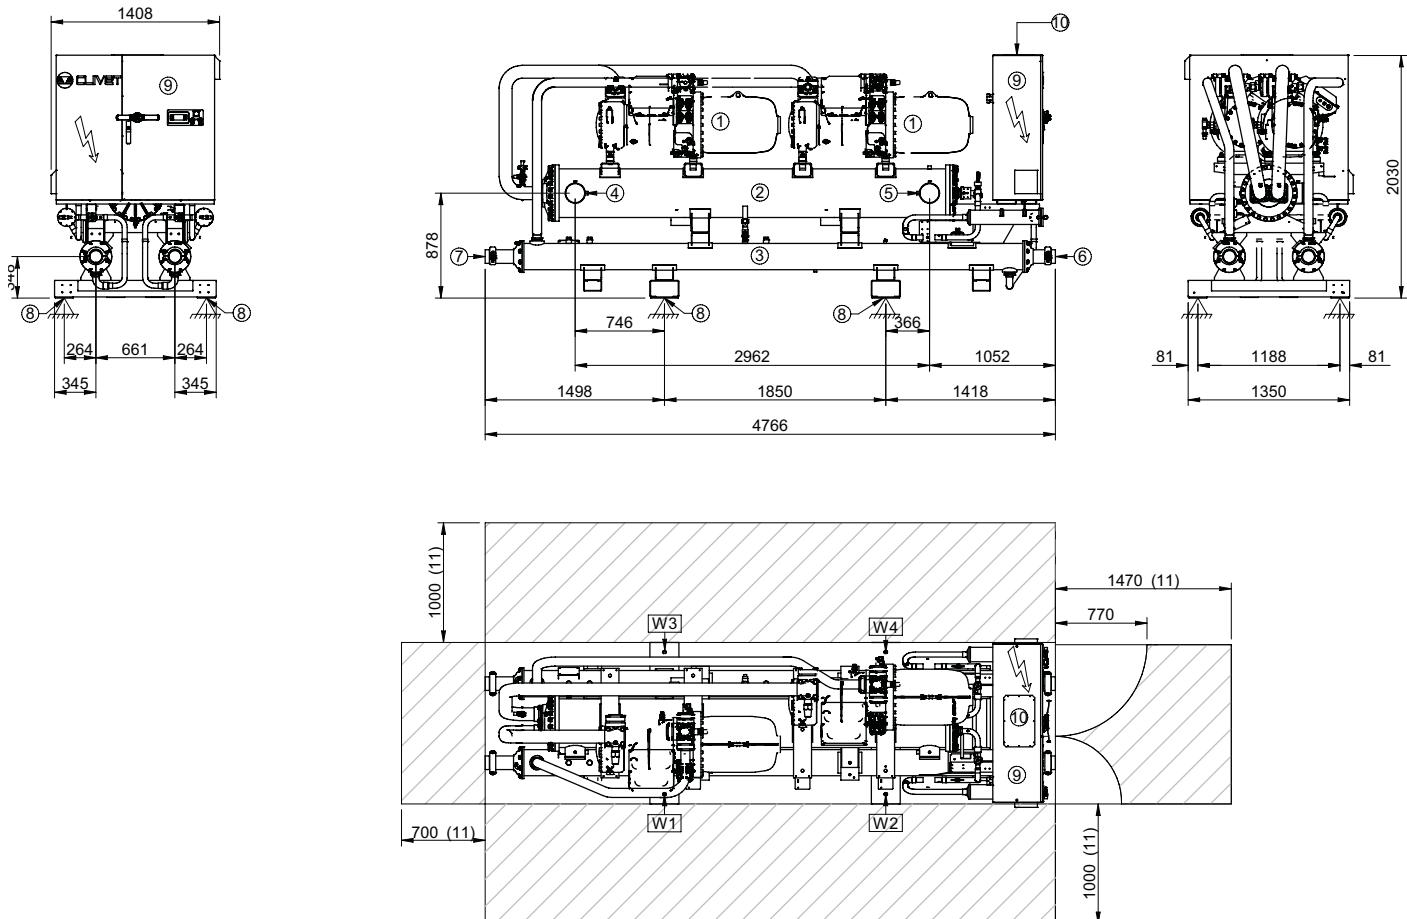

kWe = Electrical power absorbed by compressors [kW]

kWt = Heating capacity [kW]

Water temperature differential = 5°C
