# Features and benefits

LARGE EVO is the new generation of air cooled liquid chillers and heat pumps, equipped with Full DC Inverter technology and R-32 refrigerant with low environmental impact, designed for outdoor installation.

## WiSAN-YEE1

Air cooled reversible heat pump with full DC inverter technology and R-32 refrigerant

- Range 115 ÷ 233 kW
- Seasonal efficiency (SCOP) up to 4,22
- Seasonal efficiency (SEER) up to 4,51
- Operating with 48°C of outdoor air temperature in cooling
- Operating with -20°C of outdoor air temperature in heating
- Hot water production up to 60°C
- Copper/aluminum condensing coil
- Partial recovery of the condensing heat
- Plate exchanger
- 2 refrigeration circuits

The heat pump version of the LARGE EVO is available from 115 kW up to 233 kW.

Its high seasonal efficiency together with its wide operating limits make it the ideal solution for many types of installation, being at the same time the most effective and valuable solution both in terms of capital investment and running costs.

## Energy Efficiency

SCOP up to 4,22 with low water temperature (LWT 35°C).

SEER up to 4,51, which makes it extremely competitive even compared to cooling only units.

Capacity modulation from 20% to 100%.

## Extensive operating limits

	max	min
<b>Outdoor temperature</b>		
<b>heating</b>	44°C	-20°C
<b>Production of domestic hot water</b>	44°C	-20°C
<b>Cooling</b>	48°C	-15°C
 <b>Outlet water temperature</b>	 max	 min
<b>heating</b>	60°C	25°C
<b>Production of domestic hot water</b>	60°C	25°C
<b>Cooling</b>	20°C	0°C

## Mode

- Management and production of domestic hot water up to 60°C.
- Climatic compensation with external temperature
- Double set-point management
- Auxiliary generator management
- SG Ready
- EVU lock ready (remote on/off)
- Demand limit

## Acoustic configuration

Three sound configurations levels:

- Standard acoustic configuration
- Silenced acoustic configuration (-4 dB(A))
- Super-silenced acoustic configuration (-8 dB(A))

## Application versatility

All the main system components are supplied on the unit, ensuring maximum manufacturing reliability and easy installation:

- Hydropack with 1 inverter pump, low or high head
- Hydropack with 1 on/off pump, low or high head
- Hydropack with 2 inverter pumps in duty/stand-by configuration, low or high head
- Hydropack with 2 on/off pumps in duty/stand-by configuration, low or high head
- 3-way valve for domestic hot water management
- System storage tank
- Partial energy recovery
- Drain pan with electric heater

## Cascade management

LARGE EVO is designed to connect up to 8 units in a local network, reaching a maximum unit capacity of 1864 kW.

# Standard unit technical features

## Compressor

### Size 45.4 - 50.4

Inverter-controlled rotary hermetic compressor fitted with a motor protection device for overheating, overcurrents and excessive temperatures of the supply gas. It is installed on rubber antivibration mounts and comes with a full oil charge. The compressor is wrapped in a sound-absorbing hood, that reduces its sound emissions. A crankcase heater with automatic activation prevents the refrigerant from diluting the oil when the compressor stops.

### Size 55.4 - 60.4

#### Circuit 1

Inverter-controlled rotary hermetic compressor fitted with a motor protection device for overheating, overcurrents and excessive temperatures of the supply gas. It is installed on rubber antivibration mounts and comes with a full oil charge. The compressor is wrapped in a sound-absorbing hood, that reduces its sound emissions. A crankcase heater with automatic activation prevents the refrigerant from diluting the oil when the compressor stops.

#### Circuit 2

Inverter-controlled hermetic Scroll compressor with steam injection fitted with a motor protection device for overheating, overcurrents and excessive temperatures of the supply gas. It is installed on rubber antivibration mounts and comes with a full oil charge. The compressor has a sound blanket, that reduces its sound emissions and thermally insulates it

### Size 65.4 - 85.4

Inverter-controlled hermetic Scroll compressor with steam injection fitted with a motor protection device for overheating, overcurrents and excessive temperatures of the supply gas. It is installed on rubber antivibration mounts and comes with a full oil charge. The compressor has a sound blanket, that reduces its sound emissions and thermally insulates it

## Structure

Supporting structure and base made entirely of sturdy sheet steel, 12/10 thick, with hot-dip galvanised surface treatment and parts in full view painted with polyester powder RAL9001, which guarantees excellent mechanical characteristics and high corrosion resistance over time.

## Panelling

External panelling made of sheet steel, 12/10 thick, with hot-dip galvanised surface treatment and painted with polyester powder RAL9001 that guarantees greater corrosion resistance in outdoor installations and eliminates the need for periodic painting. The panels can be easily removed to fully access internal components.

## Internal exchanger

Direct expansion heat exchanger, braze-welded AISI 316 stainless steel plates, in pack without gaskets using copper as the brazing material, with low refrigerant content and large exchange surface, complete with:

- 17 mm thick external no-condensation thermal insulation in sintered expanded polypropylene;
- antifreeze heater to protect the water side exchanger to prevent ice from forming if the water temperature drops below the pre-set value.

## External exchanger

Direct expansion finned coil exchanger made with copper pipes placed on staggered rows mechanically expanded to better adhere to the fin collar. The fins are made of hydrophilic aluminium and properly spaced for maximum heat exchange efficiency. A particular refrigerant circuit prevents ice from forming on the base of the exchanger during winter operation.

## Fan

Axial fans with sickle-shaped blades made of ABS ASG-20 resin reinforced with 20% glass fibre, directly coupled to the electronically controlled motor (IP23), driven by the continuous magnetic switching of the stator. The brushless technology and the special power supply increase both the lifecycle and the efficiency. Consumption is thus reduced by as much as 50%.

The fans are housed in aerodynamically shaped nozzles to increase efficiency and minimise noise levels and are fitted with accident prevention grilles. Both fans and grilles are designed with CFD technology. Supplied with variable speed control.

## Refrigeration circuit

Two independent refrigeration circuits made of copper, brazed and factory-assembled, complete with:

- electronic expansion valve;
- 4-way reverse cycle valve;
- safety high pressure switch;
- low pressure safety switch;
- liquid receiver;
- oil separator;
- High pressure transducer
- safety thermostat against compressor drain overheating;
- Temperature sensors
- suction separator;
- low pressure safety valve

### Size 55.4 - 85.4

- economizer exchanger

## Electrical panel

The Power Section includes:

- main disconnecting switch;
- general protection fuses;
- insulation transformer to power the auxiliary circuit;
- auxiliary component protection fuses;
- AC filter on power supply
- Power supply phase sequence protection
- Protection for compressor over current
- Protection for compressor overload
- Sensor malfunction protection
- phase monitor

The control section includes:

- compressor timing and protection;
- Relay for remote cumulative fault signal
- Defrosting cycle optimization
- Condenser control
- dry contact for remote on-off control;
- dry contact for auxiliary generator management.

The control keypad includes:

- wired controller with dot-matrix display;
- Multifunction keys for ON/OFF control
- Cold, hot and auto operation mode
- alarms display and reset,
- Daily or weekly schedule
- power output for remote control;
- serial port with Modbus outlet (RS 485) for remote communication.

## Water circuit

- Temperature sensors;
- drain valve;
- antifreeze heaters to protect the water side exchanger to prevent ice from forming if the water temperature drops below the pre-set value;
- differential pressure switch, water side;
- relief valve.

## Test

Unit subjected to factory-tested in specific steps and test pressure of the piping of the refrigerant circuit (with nitrogen and hydrogen), before shipping them.

# Standard unit technical features

## Unit equipment with low outdoor temperatures

MINIMUM OUTDOOR AIR TEMPERATURE		OPERATING UNIT		UNIT IN STAND-BY <sup>(5)</sup> (fed unit)	UNIT IN STORAGE (unit not fed)
		COOLING*	HEATING*		
+11°C	1				
+2°C	2				
-5°C	4				
-7°C	3				
-10°C	4	✓ STANDARD UNIT		✓ STANDARD UNIT	✓ STANDARD UNIT <sup>(6)</sup>
From -10°C to -15°C			✓ STANDARD UNIT		
From -15°C to -20°C		NOT POSSIBLE		✓ WATER EMPTY UNIT OR WITH AN APPROPRIATE GLYCOL PERCENTAGE	NOT POSSIBLE
From -20°C to -30°C			NOT POSSIBLE	✓ WATER EMPTY UNIT OR WITH AN APPROPRIATE GLYCOL PERCENTAGE  ✗ NOT SUITABLE: BUILT-IN PUMPS	

Data referred to the following conditions:

\*production of chilled water:

internal exchanger water = 12/7°C

\*\*Production of hot water:

internal exchanger water = 30/35 °C

1. Part load unit and air speed equal to 1 m/s.
2. Part load unit and air speed equal to 0.5 m/s.
3. Part load unit and outdoor air temperature at rest.
4. Unit at full load and outdoor air temperature at rest.

<sup>(5)</sup> The water pumping unit must be fed and connected to the unit according to the manual.

<sup>(6)</sup> Unit without water or containing water with an appropriate quantity of glycol.

At the unit start-up the water temperature or water with glycol must be inside the operating range indicated in the "Operating range" graph.

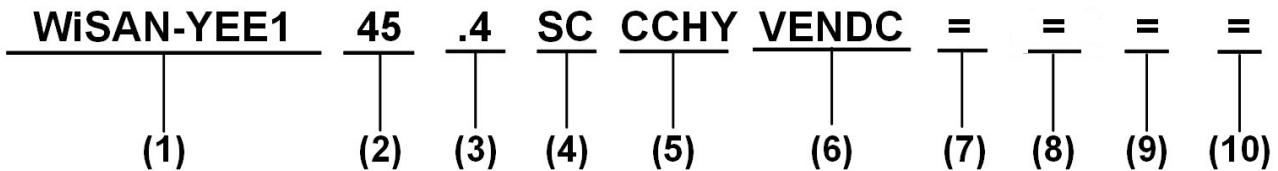

To know the water freezing temperature on varying the glycol percentage refer to the specific 'Correction factors for glycol use' table.

**⚠** Air conditions which are at rest are defined as the absence of air flowing towards the unit. Weak winds can induce air to flow through the exchanger and air-levels which can cause a reduction in the operating range.

In the presence of predominant winds it is necessary to use suitable windbreak barriers.

**⚠** The unit, with an average external air temperature below -10 °C, can be stored for a maximum of 1 month.

# Unit configuration

## (1) Range

WiSAN = Air cooled reversible heat pump with inverter compressors

## (2) Size

45 = Nominal compressor capacity (HP)

## (3) Compressors

.4 = Compressor quantity

## (4) Acoustic configuration

SC = Acoustic configuration with compressor soundproofing

LN = Silenced acoustic configuration

EN = Super-silenced acoustic configuration

## (5) Condensing coil

CCHY = Copper / aluminium condenser coil with hydrophilic treatment (Standard)

CCCA = Copper / aluminium condenser coil with acrylic lining

CCCA1 = Copper / aluminium condensing coils with Aluminium Energy Guard DCC treatment

## (6) Fans

VENDC = DC high efficiency fans (standard)

## (7) Pumping unit

(-) not required (standard)

1PM = Hydropack with N° 1 pump

1PMH = Hydropack with N° 1 high static pressure pump

1PMV = Hydropack with N° 1 inverter pump

1PMVH = Hydropack with N° 1 high static pressure inverter pump

1P1SB = Hydropack with N° 1 pump + N° 1 in stand-by

1PAP+S = Hydropack with N° 1 high static pressure pump + N° 1 in stand-by pump

1P1SBV = Hydropack with N° 1 inverter pump and N° 1 stand-by pump with dedicated inverter

1PAPSV = Hydropack with 1 high head inverter pump and 1 stand-by pump with dedicated inverter

## (8) Storage tank

(-) not required (standard)

ACC = Storage tank

## (9) Energy recovery

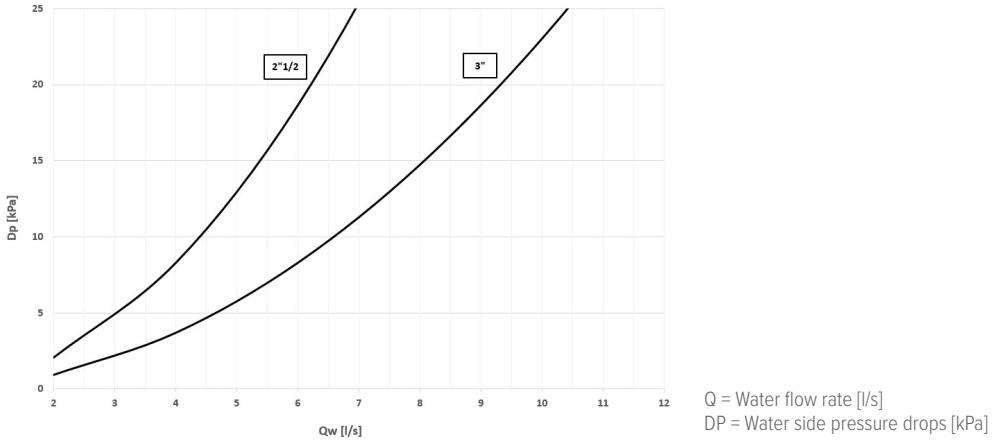

(-) not required (standard)

D = Partial energy recovery

## (10) Domestic hot water valve

(-) Not required (standard)

VACS = DHW switching valve

<b>ACC</b>	<b>Storage tank</b> Steel storage tank complete with double layer covering with closed-cell insulation, stainless steel anti-freeze immersion resistance, bleed valve, draw off cock, cast-iron shut-off butterfly valve with quick connections and activation lever with a mechanical calibration lock at the evaporator output, quick connections with insulated casing. The water tank capacity is 300 litres for sizes 45.4 to 60.4. The water tank capacity is 500 litres for sizes 65.4 to 85.4. The device is installed and wired on the unit and is located on the system's return line.
<b>CMSC13</b>	<b>Serial communication module ModBus TCP/IP, BACnet/IP, BACnet MS/TP</b> This enables the serial connection of the supervision system, using ModBus TCP/IP, BACnet/IP, BACnet MS/TP as the communication protocol. It enables access to the complete list of operational variables, commands and alarms. Using this accessory every unit can dialogue with the main supervision systems. The device is installed and wired on the unit.
	<p><b>⚠</b> The configuration and management activities for the BACnet networks are the responsibility of the client  <b>⚠</b> The total length of each individual serial line must not exceed 1000 m and the line must be connected in bus type (input/output).</p>
<b>VACS</b>	<b>DHW switching valve</b> The switching valve that diverts the water flow to a heating water tank for domestic water is installed on the unit. If the DHW temperature falls below the set-point, Large EVO switches to DHW production mode (priority over other operating modes can be set). The unit controller closes a digital output driving the flow deviation valve from the storage system until it reaches the ACS set-point set on the user interface. The water connections are 2" 1/2 Victaulic for sizes 45.4÷60.4 and 3" for sizes 65.4÷85.4.
	<b>DHW switching valve pressure drop</b>
	 <p>DP [kPa]</p> <p>Qw [l/s]</p> <p>25 20 15 10 5 0</p> <p>2 3 4 5 6 7 8 9 10 11 12</p> <p>2" 1/2      3"</p> <p>Q = Water flow rate [l/s] DP = Water side pressure drops [kPa]</p>
<b>CCCA</b>	<b>Copper/aluminium condenser coil with acrylic lining</b> Coils with copper pipes and aluminium fins with acrylic coating. They can be used in environments containing airborne concentrations of salt and other moderately aggressive agents. The treatment entails: Cooling capacity variation -2.7%. Compressor power input variation +4.2%. Operating range reduction -2.1°C.
<b>CCCA1</b>	<b>Condenser coil with Energy Guard DCC Aluminum</b> This treatment provides excellent and guaranteed thermal exchange over time and protects finned coil exchangers from corrosion. They can be used in environments containing airborne concentrations of salt and other very aggressive chemicals while maintaining coil performance over time.
<b>PGFC</b>	<b>Finned coil protection grilles</b> The grilles protect the external coil from accidental contact with objects or persons. Ideal for installation in places where persons can pass from, such as car parks, terraces, etc.
<b>PGCCH</b>	<b>Anti-hail protection grilles</b> Grille made of electro-welded and painted drawn steel suitable for protecting the external coil from hail damage. Accessory supplied installed on the unit.

# Built-in options

---

<b>TCDC</b>	<b>Drain pan with electric heater</b> The drain pan made of steel AISI 316 allows the collection and discharge of the condensate The two trays, located under the coils, are equipped with Mylar antifreeze electric heaters applied to the bottom and a drain located on the rear part, on the water connection side. The electric heaters are thermostatically controlled and are activated according to the external air temperature ( $T_a < +5^\circ C$ ).
<b>RPR</b>	<b>Refrigerant leak detector</b> The leak detector device, in-built on the unit and positioned inside the compressor compartment, detects leaks from the internal refrigeration circuit.
<b>REMAU</b>	<b>Additional board for advanced functions management</b> Multifunction board installed in the electrical panel of the unit for the advanced functions management. The available digital contacts allow the following remote functions: <ul style="list-style-type: none"><li>• remote on/off</li><li>• heat/cool (summer/winter switch)</li><li>• DHW production (heat pump version only)</li><li>• Double set-point management</li><li>• Sready function</li><li>• EVULock function</li><li>• Demand limit</li><li>• Activation of silent or super-silent acoustic version (selectable on the user interface)</li></ul> The additional board does not allow the simultaneous use of digital inputs and Modbus signal.
<b>ABU</b>	<b>Water connections flush with the unit are required</b> The water connections of the unit in standard configuration (without hydronic groups installed on board, or accumulation tank or DHW switching valve), end at the plate heat exchanger. It is necessary to select this option if water connections flush with the unit are required If hydronic groups or buffer tank or DHW switching valve are selected, the ABU option is automatically selected.

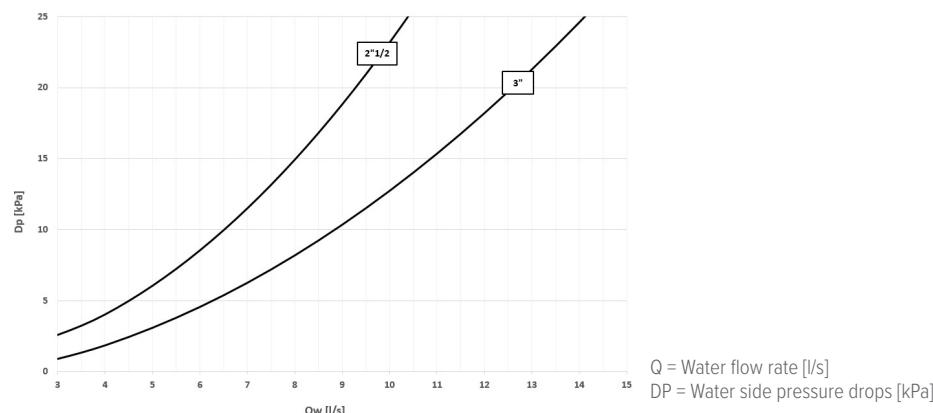

# Accessories supplied separately

## IFWX

### Water side steel mesh filter

The device prevents any impurity in the hydraulic circuit from soiling the exchanger. The stainless steel mesh mechanical filter must be placed on the water inlet line. It needs to be easy to remove for periodical maintenance and cleaning operations. The Victaulic filter water connections are 2" 1/2 for sizes 45.4 to 60.4 and 3" for sizes 65.4 to 85.4.

### Filter pressure drop

## AVIBX

### Anti-vibration mount support

The rubber antivibration mounts are attached in special housing on the support frame and serve to smooth the vibrations produced by the unit, thus reducing the noise transmitted to the support structure.

## AMMSX

### Anti-seismic spring antivibration mounts

The anti-seismic spring antivibration mounts must be fastened in special housings on the supporting metal struts. The containment structure is designed to ensure high resistance multidirectional forces acting on the surface of the unit in the presence of wind and / or telluric movements. The antivibration mounts have been tested according to ANSI/ASHRAE standard 171-2008 (Method of Testing Seismic Restraint devices for HVAC&R Equipment). The performance levels and test methodology have been validated and certified by Lloyd's Register.

**⚠** Installation provided by the Customer.

## PGFCX

### Finned coil protection grilles

The grilles protect the external coil from accidental contact with objects or persons. Ideal for installation in places where persons can pass from, such as car parks, terraces, etc.

## PGCCHX

### Anti-hail protection grilles

Grille made of electro-welded and painted drawn steel suitable for protecting the external coil from hail damage.

## IOTX

### IoT industrial module for cloud based interoperability & services

This device allows the monitoring and the remote control the unit via Clivet Eye, the supervision cloud system for Clivet units.

With IoT module (i-LINK) it will be possible to monitor and manage the unit through the mobile app Clivet Eye and the dedicated web page.

Among the main functions, for all monitored units they allow to:

- display the main working parameters;
- display the alarms;
- switch on/off the unit;
- change the setpoint;
- change the operating mode;
- set the daily/weekly start-up or power-off programming of the unit;
- create charts of main system parameters trend (via web interface);
- display in a map the units monitored by Clivet Eye (via web interface).

Web interface at [www.cliveteye.com](http://www.cliveteye.com).

Clivet Eye app available in Google Play and Apple Store

**⚠** IoT module to be provided for each unit to be remotely monitored.

**⚠** Internet ethernet connection in charge of customer.

**⚠** Clivet Eye management is alternative to an external BMS supervision system.

**⚠** Installation provided by the Customer.

The Product complies with the European ErP Directive (Energy Related Products), which includes the Commission Regulation (EU) 2016/2281, also known as Ecodesign LOT21.  
Contains fluorinated greenhouse gases (GWP 675)

1. Data referring to the following conditions: Water temperature to the internal exchanger = 12/7 °C. Temperature of air entering the external exchanger = 35°C. Evaporator fouling factor =  $0.44 \times 10^{-4}$  m<sup>2</sup> K/W
2. The Total Power Input value does not take into account the part related to the pumps and required to overcome the pressure drops for the circulation of the solution inside the exchangers
3. Recovery exchanger water = 40/45°C
4. Data compliant to Standard EN 14511:2018 referred to the following conditions: internal exchanger water temperature = 12/7 °C. Entering external exchanger air temperature = 35°C
5. Data calculated in accordance with AHRI 550/590 under the following conditions: Water temperature to the internal exchanger = 6,7 °C. Water flow-rate 0,043 l/s per kW. Temperature of air entering the external exchanger = 35°C. Evaporator fouling factor =  $0.18 \times 10^{-4}$  m<sup>2</sup> K/W
6. Data calculated in compliance with EN 14825:2018.
7. Data calculated according to the EU 2016/2281 Regulation
8. Data referring to the following conditions: Internal heat exchanger water temperature = 40/45 °C. Temperature of air entering the external exchanger = 7°C D.B./6°C W.B. Evaporator fouling factor =  $0.44 \times 10^{-4}$  m<sup>2</sup> K/W
9. Data calculated in accordance with EN 14511:2013 under the following conditions: Internal heat exchanger water temperature = 40/45 °C. Temperature of air entering the external exchanger = 7°C D.B./6°C W.B.

1. PHE = Plate exchanger

2. CCHY = Copper / aluminium condenser coil with hydrophilic treatment

3. AX = Axial fan

4. M.I.C.=Maximum unit starting current. The M.I.C. value is obtained adding the max. compressor starting current of the highest size to the power input at max. admissible conditions (F.L.A.) of the remaining electric components.

Voltage unbalance between phases: max 2 %

Voltage variation: max +/- 10%

Electrical data refer to standard units; according to the installed accessories, the data can suffer some variations.

<b>85.4</b>	77	73	72	75	78	75	69	66	63	81		

Sound levels refer to full load units, in test nominal conditions. The sound pressure level refers to 1 m. from the standard unit outer surface operating in open field. Measures according to UNI EN ISO 9614-2 regulations, with respect to the EUROVENT 8/1 certification, which provides for a tolerance of 3 dB(A).

Data referred to the following conditions:

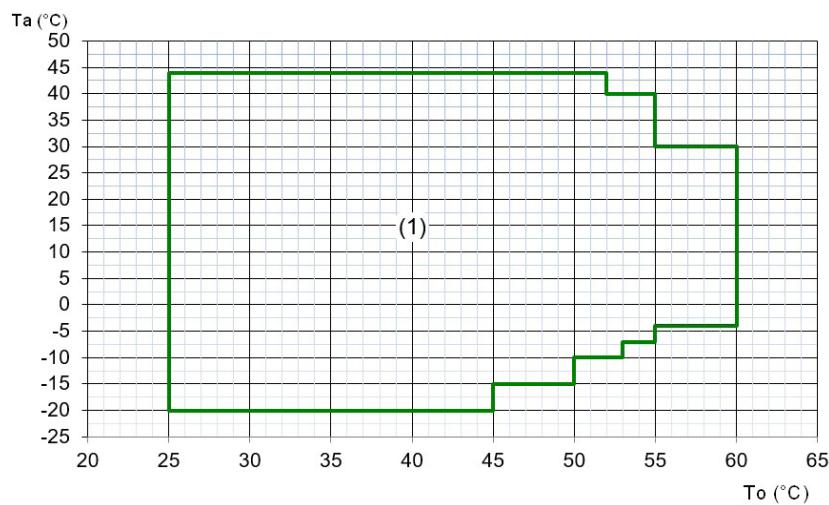

- internal exchanger water temperature = 12/7 °C
- Temperature of air entering the external exchanger = 35°C.

## Operating range - Cooling

1. Standard unit operating range
2. Operating range where the use of glycol is mandatory in relation to the temperature of the outlet water from the user side exchanger

## Operating range - Heating

1. Standard unit operating range

# General technical data

kWf = Cooling capacity in kW

kWe\_tot = Total power input in kW

To (°C) = Internal exchanger outlet water temperature

Performances in function of the inlet/outlet water temperature differential = 5°C

# General technical data

## Performance - Cooling

kWf = Cooling capacity in kW

kWe\_tot = Total power input in kW

To (°C) = Internal exchanger outlet water temperature

Performances in function of the inlet/outlet water temperature differential = 5°C

# General technical data

## Plate exchangers pressure drop (EVPHE)

The pressure drops are calculated considering a water temperature of 7°C

Q = Water flow rate [l/s]

DP = Water side pressure drops [kPa]

The water flow rate must be calculated with the following formula

$$Q \text{ [l/s]} = kWf / (4,186 \times DT)$$

kWf = Cooling capacity in kW

DT = Temperature difference between inlet / outlet water

## Admissible water flow rates

Minimum (Qmin) and maximum (Qmax) admissible water flow rates for correct operation of the unit.

SIZE	45.4	50.4	55.4	60.4	65.4	70.4	75.4	80.4	85.4

kWt = Heating capacity in kW

kWe\_tot = Total power input in kW

Ta = Temperature of air entering the external exchanger

D.B. = Dry bulb

W.B. = Wet bulb

## Integrated heating capacities

External exchanger inlet air temperature °C (D.B/W.B.)	-7/-8	-5/-6	0/-1	2/1	Other
Heating capacity multiplication coefficient	0,90	0,89	0,88	0,90	1,00

The integrated heating capacity is the actual heating capacity, including the impact of any defrosting cycles.

To obtain the integrated heating capacity multiply the heating performance value in kWt (shown in the heating performance tables) by the coefficients indicated in the table.

In prolonged heat pump operating mode with negative ambient temperature, it is important to drain the water produced by the defrosting cycles to prevent the build-up of ice near the base of the unit. Ensure this does not pose a danger to property or persons.

Load = Percentage of cooling capacity compared to the value at full load

kWt = Heating capacity (kW)

kWe\_tot = Total power input in kW

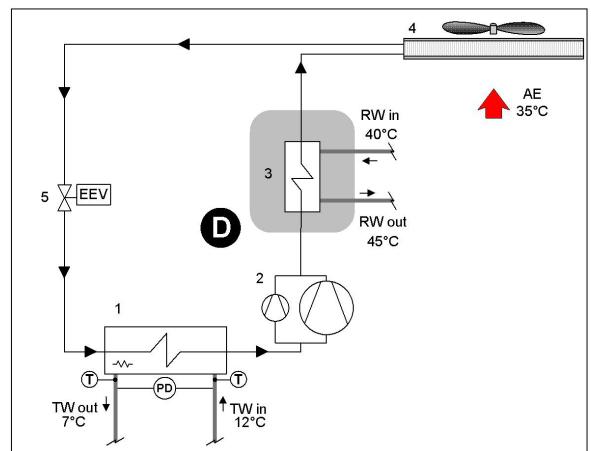

Internal heat exchanger water temperature = outlet 45°C / inlet 40°C / Variable flow-rate with external exchanger air T

## D - Partial energy recovery

A configuration which enables the production of hot water free-of-charge while operating in the cooling mode, thanks to the partial recovery of condensation heat that would otherwise be disposed of into the external heat source. This option is also known as "desuperheater". It is made up of a Inox 316 stainless steel brazed plate heat exchangers, suitable for recovering a part of the capacity dispersed by the unit (the dispersed heating capacity is equal to the sum of the cooling capacity and the electrical input capacity of the compressors). The partial recovery device is considered to be operating when it is powered by the water flow which is to be heated. This condition improves the unit performance, since it reduces the condensation temperature: in nominal conditions the cooling capacity increases indicatively by 3.2% and the power input of the compressors is reduced by 3.6%.

When the temperature of water to be heated is particularly low, it is necessary to control the flow-rate to maintain the outlet temperature at recovery above 35°C and prevent condensation of the refrigerant in the partial energy recovery device.

The water connections of the partial energy recovery device are 1" 1/4 for all sizes.

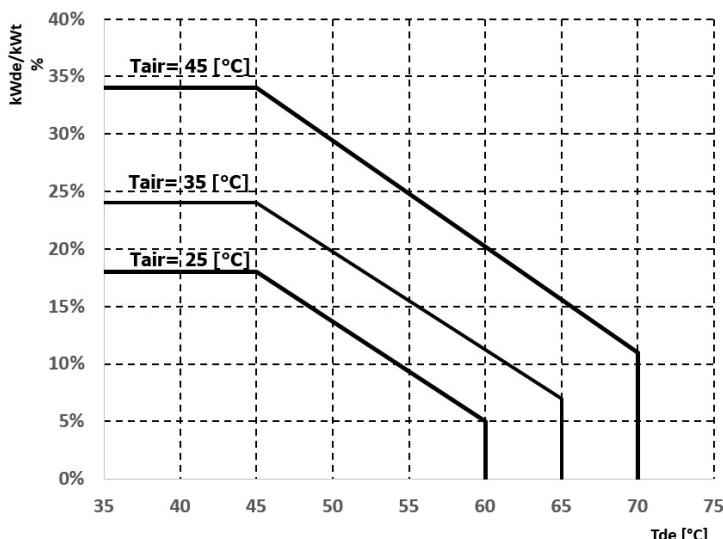

**D - Partial recovery device**

## 1PM - HydroPack with N° 1 pump

Pumping group consisting of an electric centrifugal pump with cast iron pump body and stainless steel or cast iron impeller (depending on the model).

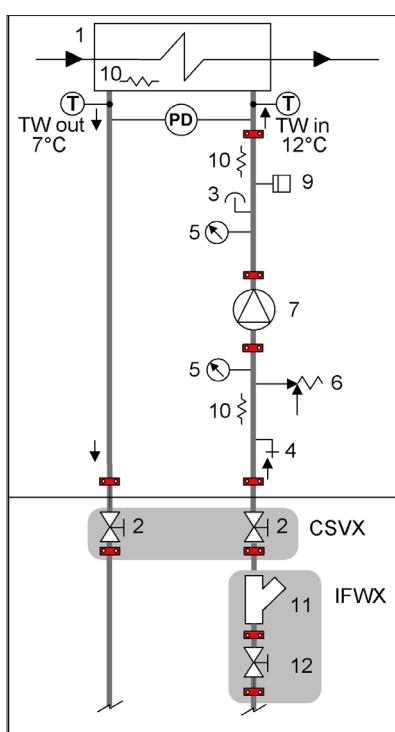

Mechanical seal using ceramic, carbon and EPDM elastomer components.

Three-phase electric motor with IP55 protection rating. Complete with thermoformed insulating casing, quick-release couplings with an insulated casing, safety valve, pressure gauges, system load safety pressure switch, stainless steel immersion antifreeze heaters fitted on the supply and suction lines.

All the water connections are Victaulic.

Option supplied on the unit.

## 1PMV - User side Hydropack with 1 inverter pump

Pumping group consisting of an electric pump controlled by inverter to adapt to different conditions of use.

Automatically reduces the liquid flow-rate in critical conditions, thereby preventing overloading blockages and the subsequent intervention of specialised technical personnel.

The pump flow-rate/head can be adapted to the system features by calibrating the inverter, which is standard supplied.

Electric centrifugal pump with cast iron pump body and stainless steel or cast iron impeller (depending on the model).

Mechanical seal using ceramic, carbon and EPDM elastomer components.

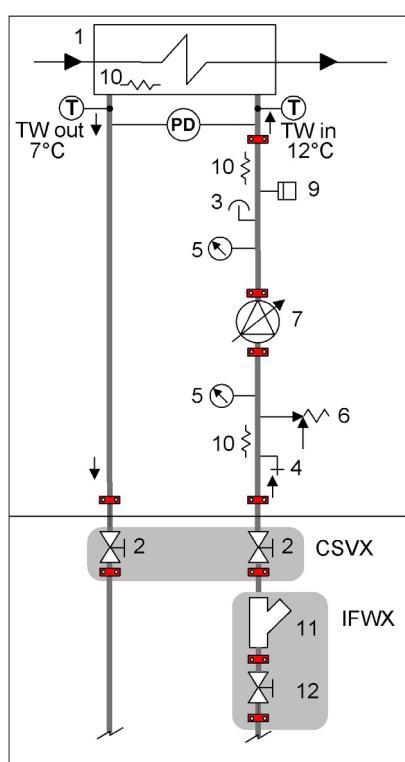

Three-phase electric motor with IP55 protection rating. Complete with thermoformed insulating casing, quick-release couplings with an insulated casing, safety valve, pressure gauges, system load safety pressure switch, stainless steel immersion antifreeze heaters fitted on the suction and supply lines.

In combination with the "IVFDT" - Variable flow-rate control option, it allows variation of the water flow-rate to the system under partial-load to achieve the highest unit efficiency and lower consumption of the pumping group.

All water fittings are Victaulic.

Option supplied on the unit.

# Accessories - Hydronic assembly

## 1PAPSV - User side Hydropack with 1 high head inverter pump and 1 standby pump with dedicated inverter

Pumping group consisting of 1+1 electric pump (1 stand-by) controlled by inverter to adapt to different conditions of use.

Automatically reduces the liquid flow-rate in critical conditions, thereby preventing overloading blockages and the subsequent intervention of specialised technical personnel.

The pump flow-rate/head can be adapted to the system features by calibrating the inverter, which is standard supplied.

Electric centrifugal pump with cast iron pump body and stainless steel or cast iron impeller (depending on the model).

Mechanical seal using ceramic, carbon and EPDM elastomer components.

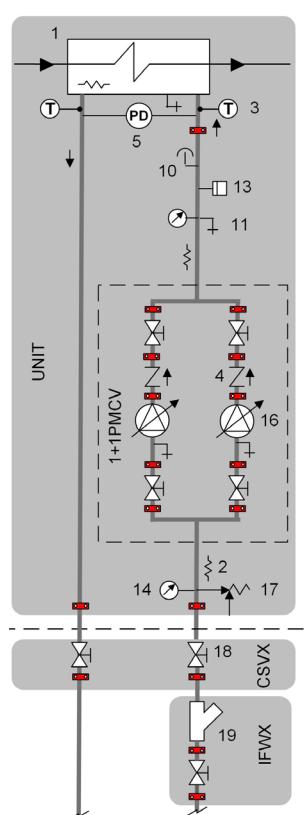

Three-phase electric motor with IP55 protection rating. Complete with thermoformed insulating casing, quick-release couplings with an insulated casing, safety valve, pressure gauges, system load safety pressure switch, stainless steel immersion antifreeze heaters fitted on the suction and supply lines.

In combination with the "IVFDT" - Variable flow-rate control option, it allows variation of the water flow-rate to the system under partial-load to achieve the highest unit efficiency and lower consumption of the pumping group.

All water fittings are Victaulic.

Option supplied on the unit.

## User interface (HMI)

Resolution	1°C	
Temperature sensor	NTC 5k 1%	
Power input	< 1 W	
Storage temperature	-20÷50°C	
Communication	RS485	
Wiring	Type MAX Length	Shielded cable 40 m

The unit is equipped with a user interface (HMI) installed on board, to be used for managing the functions and equipped with an integrated temperature probe.

The user interface comes standard with 22 selectable languages: Italian / English / French / Spanish / Polish / Portuguese / German / Dutch / Romanian / Russian / Turkish / Greek / Swedish / Slovenian / Czech / Slovakian / Bulgarian / Serbian / Danish / Ukrainian / Hungarian / Croatian

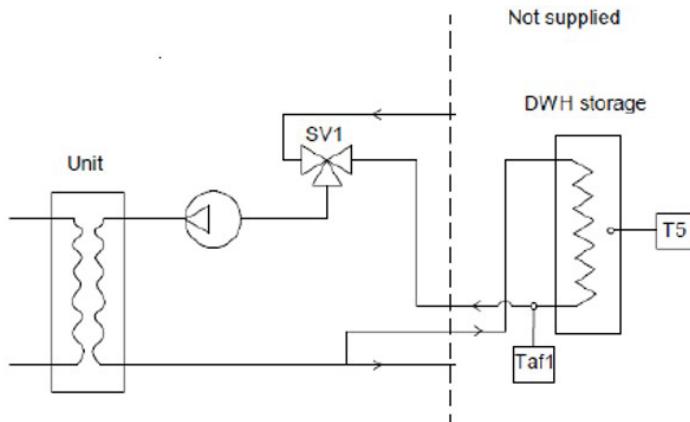

# Features and options

## DHW management

The following components are required for DHW management:

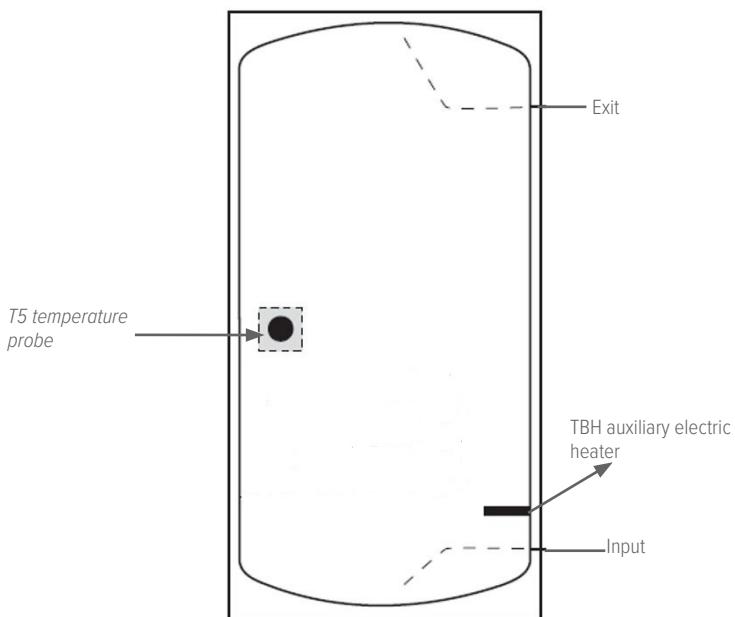

- SV1: 3-way valve
- Taf1: temperature probe, for DHW antifreeze protection
- T5: Temperature probe, for temperature control and switch between system and DHW

## DHW tank connection

As an option, the unit can be connected to a DHW storage tank of suitable volume, by fitting the system with a 3-way diverter valve controlled by the unit. It is advisable to connect the DHW tank at a distance of no more than 10 m from the unit, and preferably as close as possible to the unit. The sizing of the connecting pipes and their thermal insulation must always be considered with care, especially in the case of long distances between the unit and the storage tank.

The standard boiler must have these characteristics:

It is recommended to select one with sacrificial anode and integrated auxiliary electric heater, which will be managed by the unit. Make sure that the coil or the intermediate exchanger are suitably sized to ensure correct heat exchange.

## Double Set-Point function

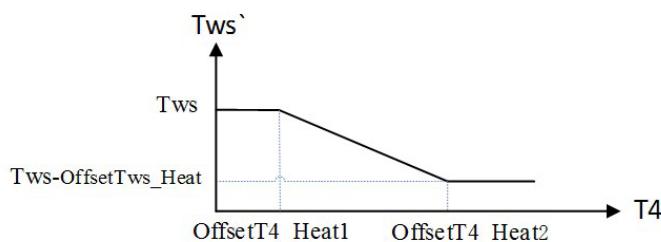

It allows to enable the Double setpoint function with HMI. Once enabled, you need to configure the first target water temperature (SetPoint1) and second target water temperature (SetPoint2). At this point the unit detects the closed status of the Double\_SP door (normally open). If the contact is open, the unit will operate at the first target water temperature; otherwise, it will operate at the second target temperature.

## Set-Point compensation function based on the outside air temperature

Allows to enable the temperature compensation function via HMI. Once the function has been enabled, it is necessary to set:

- The two offset points for the external air temperature (OffsetT4\_1; OffsetT4\_2), which will define the external air temperature field on which the set-point variation will take place;
- The offset point for the water production temperature (OffsetTws) which represents the maximum variation of the set-point allowed. Consequently the unit will update the proportional set-point according to the calculation cycle of the compensation function.

### Example of temperature compensation in heating

- When the external air temperature ( $T_4$ ) is lower than the offset one ( $T_4 < OffsetT4\_Heat1$ ) the set-point remains unchanged
- When the external air temperature ( $T_4$ ) is between the two offset temperatures ( $OffsetT4\_Heat1 \leq T_4 < OffsetT4\_Heat2$ ), the set-point is reduced in direct proportion to the increase in external air temperature.
- When the outside air temperature ( $T_4$ ) is higher than the highest offset temperature ( $T_4 \geq OffsetT4\_Heat2$ ) there will be the maximum reduction in the set-point temperature.

## ENEMON function

Through the HMI it is possible to access the display of the main energy parameters of the displayed circuit and in detail:

Power Output = instantaneous power produced in kW  
 Power Input = instantaneous power absorbed in kW  
 Current efficiency = instantaneous efficiency represents the EER or the COP  
 Total energy production is the cumulative energy produced in MWh  
 The total energy input is the cumulative energy input in MWh

STATE QUERRY	
POWER OUTPUT	100 KW
POWER INPUT	50 KW
CURRENT EFFICIENCY	2
TOTAL ENERGY OUTPUT	10 MWh
TOTAL ENERGY INPUT	3 MWh
BACK	2/2
	▲▼ ◀▶

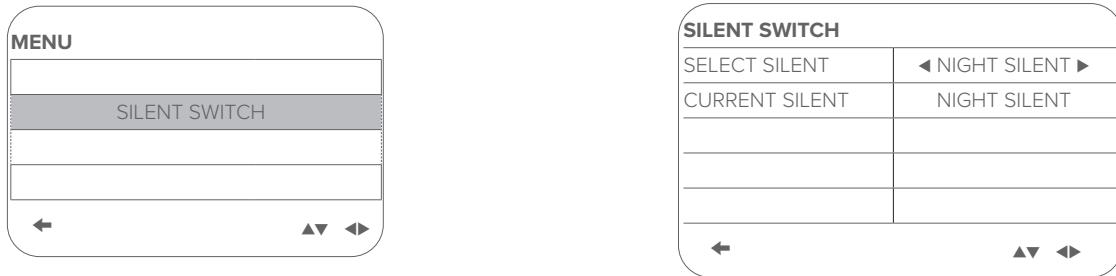

All energy meter display items are available via Modbus, on addresses from 232+(Circuit adress)\*100 a 236+(Circuit adress)\*100.

# Features and options

## SILENT function

The function allows to select up to four acoustic modes, for maximum sound configurability of the units. For three of these modes, Standard, Silent and Supersilent, the heating/cooling capacity, efficiencies and sound levels of all sizes are shown in the general technical data section of the bulletin, as well as on the navigator.

The Night Mode configuration, on the other hand, allows for a further reduction in the sound level of up to 3 dB(A) compared to the supersilent mode, for an even lower acoustic impact of the unit. To select the mode of interest, simply set it from the HMI through the User menu as shown in the following screen.

## Smart Grid & EVU functions (REMAU option required)

The unit is certified Smart Grid Ready and is equipped with logic for connection to devices that balance the loads connected to the electric grid and optimize general electricity consumption. The connection is optional, the function can be enabled from the REMAU and is linked to the ON/OFF SG input, which receives a status signal from the electrical network.

The unit is also set up to store free thermal energy in the DHW tank. The function is activated by the REMAU enabling the Smart Grid function and is linked to the ON/OFF EVU input, which receives a signal from the energy meter which indicates to the unit when free energy overproduction is available.

The regulation logic of the two contacts is:

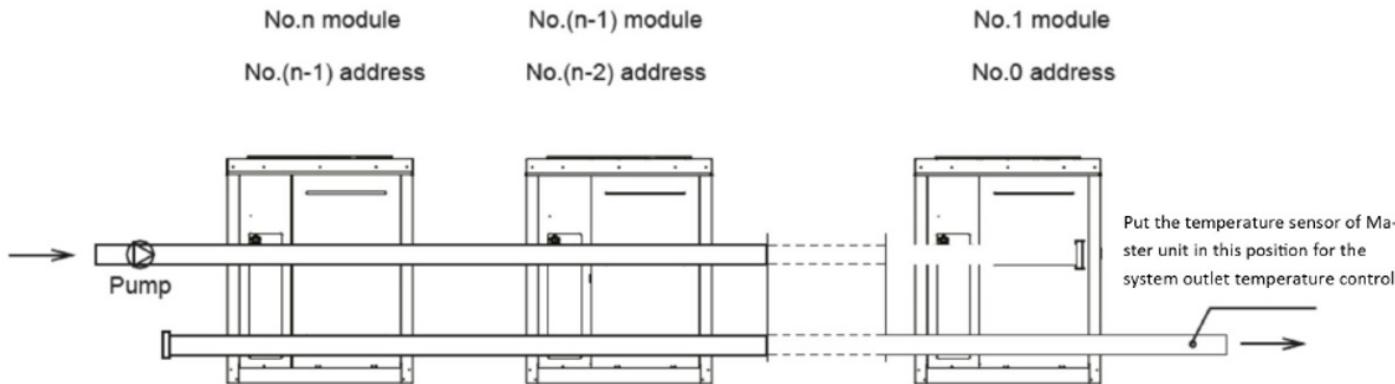

CONTACT		OPERATION	
SG	EVU	SYSTEM	DHW
ON	ON	DHW forced	Forced DHW operation with set point T5S = 60°C Once the DHW set-point is reached, the Heat Pump returns to work on the system
OFF	ON	OFF forced	OFF forced
OFF	OFF	Standard	Standard
ON	OFF	Standard	Standard

# Modularity and management of cascade units

## Modularity

Many applications require drives to be installed as back-up to the main system or have loads that can change significantly during annual operation.

Through this function, without the aid of further accessories, it is possible to operate with up to 8 units hydraulically connected in parallel. From the user interface of the unit defined as Master, the other units are electrically connected in series through the dedicated terminals P, Q and E. Each connected module is identified by an address, from 0 to 15: the Master unit is identified as 0. Complete control of the system (including ancillary elements such as external pumping system and auxiliary heater) is handled by the Master unit.

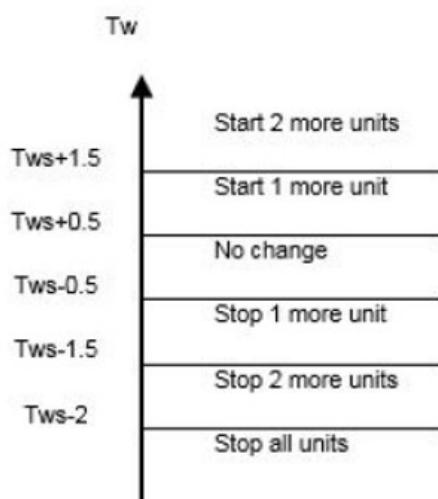

## Operation

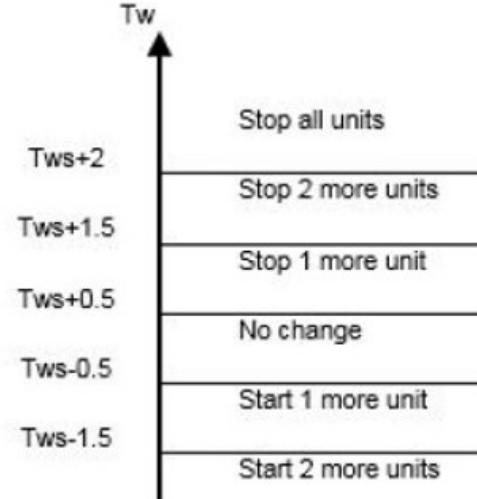

The Master unit calculates the required heating/cooling capacity of the system based on the water delivery temperature and the temperature set-point. Instead, each individual unit calculates its required heating/cooling capacity based on the delivery and return temperatures. The activation of the units takes place according to the last in first out logic (the last unit to be activated will also be the first to be deactivated) and is indicated in the following two figures.

- $T_w$  = Water supply temperature
- $T_{ws}$  = Water supply temperature set-point

### Cooling mode

### Heating mode

In cooling mode, if  $T_w \geq T_{ws} - 10^\circ\text{C}$  50% of the system units are activated.

In heating mode, if  $T_w \leq T_{ws} - 10^\circ\text{C}$  50% of the system units are activated.

After having satisfied the system load and having deactivated the units, at the next start-up the first unit to have been deactivated will be the first to be started, in order to guarantee the correct balancing of the operating hours.

# Modularity and management of cascade units

## DHW (Domestic Hot Water) settings and management

The unit is designed to be coupled to boilers for DHW storage (enabled by HMI), connected with a special T5 probe. To switch from system operation to DHW production, the system will first be stopped and then switch to DHW.

There are two conditions verified before starting DHW production:

**CONDITION 1** that the temperature T5 detected by the DHW storage is higher than the minimum value for starting DHW production, and lower than the minimum value between the DHW storage set-point temperature and the maximum temperature that the unit is able to guarantee at a given external temperature, net of the temperature delta for DHW production input equal to the default 8°C

**CONDITION 2** that the unit outlet temperature is lower than the minimum value between the DHW storage set-point temperature and the maximum supply temperature that the unit is able to guarantee at a given outside temperature, net of 2°C by default.

DHW production is stopped if:

- Domestic hot water mode is stopped via HMI
- The detected temperature T5 is higher than the minimum value between the DHW storage set-point temperature and the maximum temperature that the unit is able to guarantee at a given external temperature
- The detected temperature T5 is lower than the minimum value for starting DHW production
- The temperature output from the unit is greater than the minimum value between the maximum supply temperature that the unit is able to guarantee at a given outside temperature and the unit target set-point increased by 2°C

### Installation with multiple pumps on the system

In the system with multiple pumps, both master and slave units must be configured separately for DHW operation, and consequently it will be necessary to set DHW production as priority. DHW priority is configurable from the following menu screen:

#### • Priority DHW production

Once the DHW priority has been set, if the unit is in stand-by, CONDITION 1 is evaluated as in the case of a system with a single pump, and if this is verified, the production of domestic hot water is started, if otherwise, the unit is started to satisfy the system load.

If CONDITION 1 is verified when the unit has exceeded the minimum system side operating period, DHW production is started, otherwise the activation of the auxiliary heater TBH is evaluated and DHW production passes to the booster pump. heat only after the minimum period of operation on the system side and CONDITION 1 are satisfied.

#### • Non priority DHW production

If the DHW priority has not been set, the unit is started directly to satisfy the system load, and CONDITION 1 is evaluated only after the minimum system side operating time has elapsed. If this is satisfied, it is started DHW production, otherwise the activation of the auxiliary heater TBH is evaluated and DHW production passes to the heat pump only after CONDITION 1 is satisfied.

DHW SWITCH	
SELECT ADRESS	◀ 11 ▶
DHW SWITCH	◀ SI ▶
PRIORITY	◀ SI ▶
07 06 05 04 03 02 01 00	
15 14 13 12 11 10 09 08	

In DHW production mode, the compressors start only if the DHW tank temperature is above a minimum threshold (see table). To avoid the temperature falling below the minimum threshold, it is recommended to install an electric backup heater on the DHW storage tank.

T outdoor	T5	compr.	backup heater
24°C < t.o ≤ 30°C	< 15°C	OFF	ON
24°C < t.o ≤ 30°C	≥ 15°C	ON	OFF
t.o > 30°C	< 20°C	OFF	ON
t.o > 30°C	≥ 20°C	ON	OFF

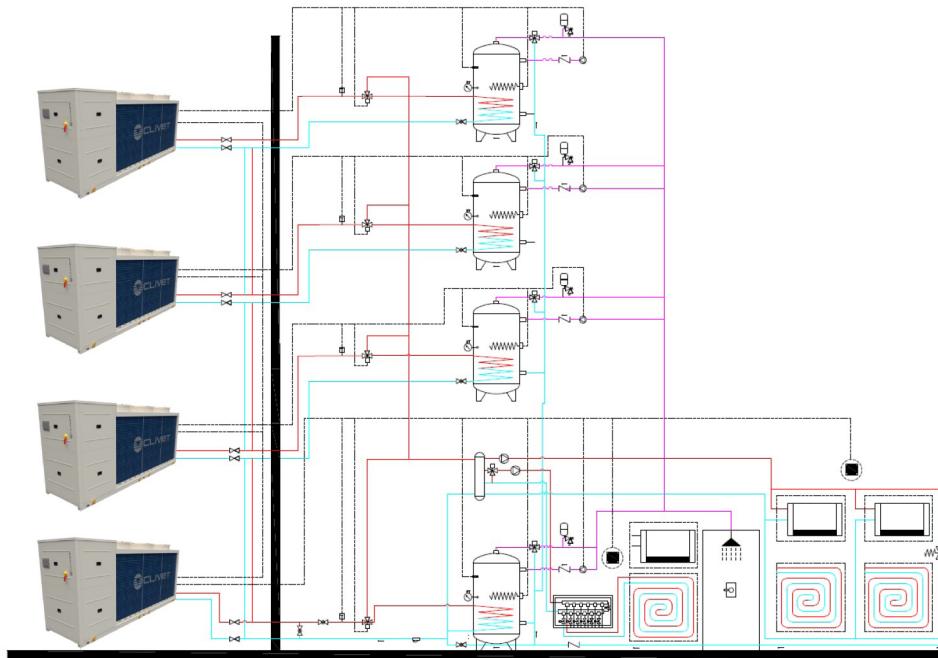

The maximum system supply for T5S (DHW set-point) is lower than the maximum set point that can be reached by the unit to consider heat exchange.

num value that can be set

# Management mode

Applications may require different management mode. Through the modular system it is possible to configure the system in different modes, here below some example:

- A. Configuration with independent operation: in this configuration it is necessary to have a DHW tank for each unit and a DHW three-way valve for each unit. The operation of each unit is independent from the others, each unit manages its own DHW production request.

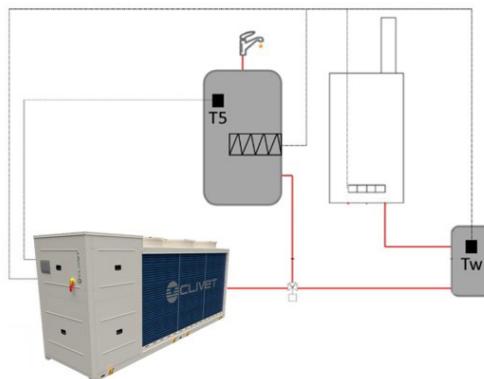

# Management of auxiliary heat sources

The optimal configuration solution of the auxiliary heat source involves the positioning of the electric heater in derivation on a DHW tank and the positioning of the boiler on the system.

The electric heater must be positioned into the DHW tank and its operation is linked to a dedicated T5 able to detect the DHW tank temperature.

The boiler must be installed in parallel with the heat pump and acts on the system: it is installed on a hydraulic separator, where the TW probe must also be positioned.

The setting must be completed during installation, by selecting the boiler operating mode using the unit keyboard.

The auxiliary heater source can perform the function of integration to the heat pump. To activate the functions of the heat pump integration heater, make sure that Dip-Switch S6-1 is in the ON position (upwards) and you must have activated Heat1 from the HMI; as regards the other parameters, they must be configured according to your needs once you understand their function which is described below.

Within 2 minutes of switching on the pump, the auxiliary heater control is kept OFF and the following cases may arise:

- Operation of the auxiliary heater in place of the heat pump: When the heat pump cannot operate due to a fault or is in protection mode (compressors not limited): in this case the auxiliary heater intervenes in place of the heat pump when the water temperature is less than 3K compared to the set point and switches off once the water temperature has exceeded the set point by 2K (adjustable value from the HMI).
- Heat 1 activation forcing: In this mode, manual operation of the auxiliary heater will be started. Once the set point is reached the auxiliary heater will switch off. The manual command is valid only once therefore even if the water temperature drops below the setpoint it will not start automatically and will need a new manual command to start.
- Operation of the auxiliary heater at low air temperature: In case the unit is operating in heat pump mode with an air temperature lower than 5°C (Value adjustable from the HMI) but does not reach the set point within 90 min (value adjustable from the HMI), then the auxiliary heater integrates with the heat pump.
- Activation of the auxiliary heater in integration with the heat pump: If the set point is higher than the maximum set point of the unit envelope, then the auxiliary heater is activated in integration with the heat pump.

Title	Effect	Predetermined Area	Default
Heat1 Enable	Riscaldatore ausiliario impianto	No/Yes	No
T_Heat1_Delay	Tempo di attivazione	60.....240 min	90 min
DT_Heat1_OFF	ΔT off rispetto al set point	2.....10°C	5°C
T4_Heat1_ON	Temperatura dell'aria sotto la quale interviene Heat1	-5.....13°C	5°C

A further HEAT2 function is also available, useful for controlling the auxiliary heater for DHW storage. This function must also be enabled from the HMI and requires the installation of a T5 probe which makes possible the DHW auxiliary heater management very similar to the ones already explained previously. Only one differs substantially and is the intervention of the auxiliary generator during the disinfection process of the domestic hot water storage, which takes place as described below:

Intervention of the auxiliary heater in the DHW storage disinfection process. Once the function has been enabled from the HMI, this sends the disinfection cycle request:

If the unit is in stand-by/cooling or heating mode, it enters DHW mode and starts the disinfection cycle;

If the unit is performing a defrost cycle, the cycle is completed first and then the disinfection function is activated.

In this process, the permanence of the DHW storage tank temperature T5 above 69°C is evaluated. whenever the temperature drops below 69°C.

At the beginning of the disinfection cycle, on the other hand, a second Timer2 time count starts.

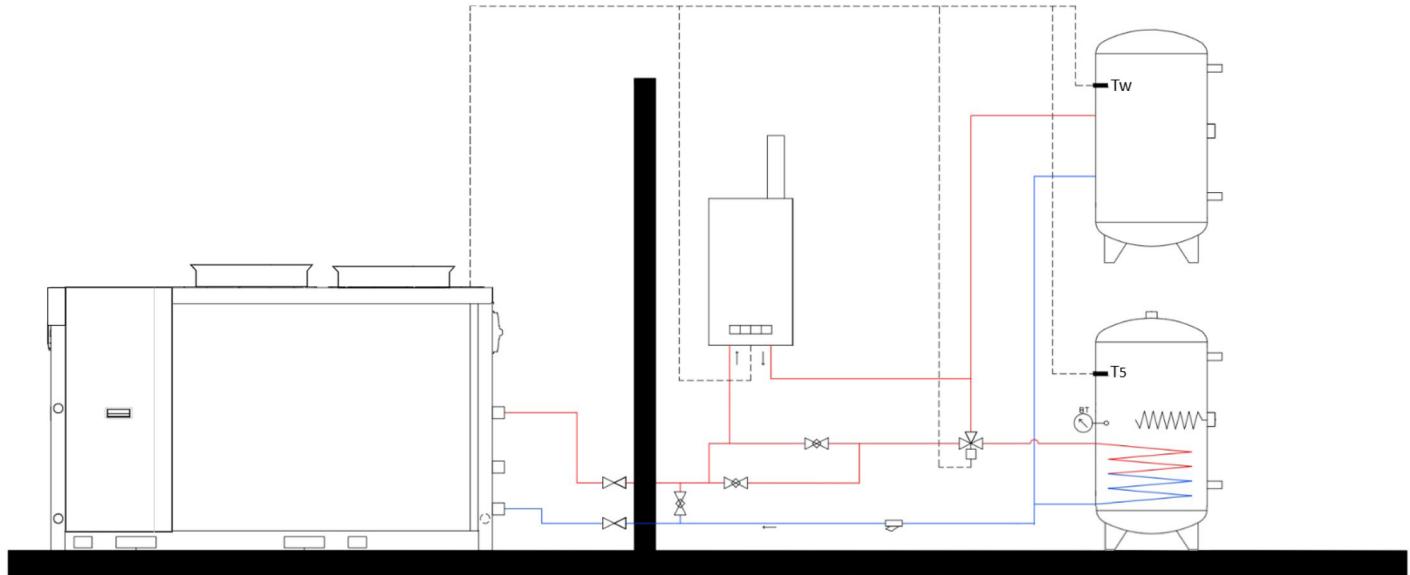

Based on the two time parameters above, the disinfection cycle ends if the domestic hot water storage tank has maintained a temperature equal to or higher than 69°C for at least twenty minutes, or if the disinfection cycle has lasted at least 60 minutes

The unit therefore allows the hybrid version solution in combination with a third-party generator, thanks to the control of the auxiliary generator via the HEAT1/HEAT2 contacts as previously reported.

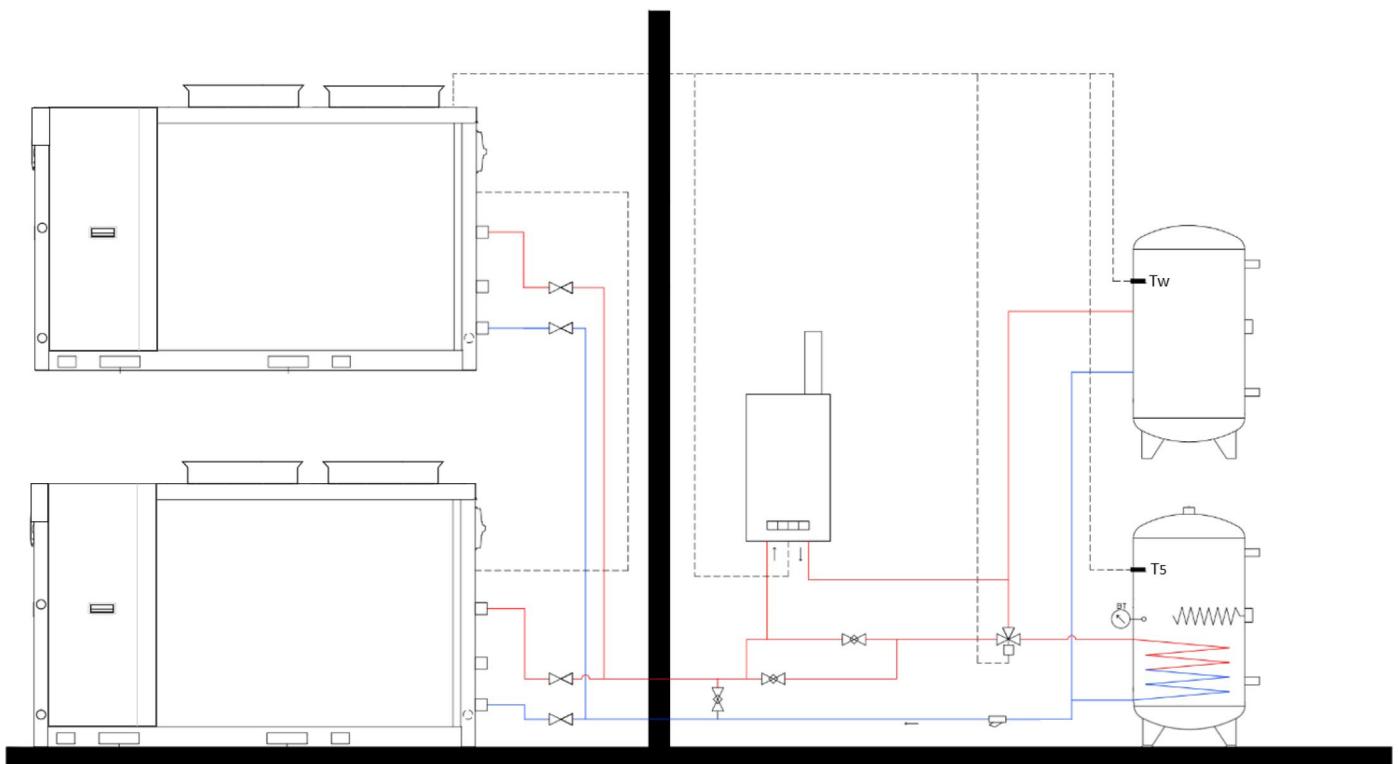

Some simplified functional diagrams are shown below with different combinations of unit and boiler: these diagrams are proposed by way of example.

In a multi-zone configuration with one or more heat pump units in cascade, and a single gas boiler, the auxiliary heat generator will be activated when the heat pump or the heat pump cascade system is not sufficient to satisfy the demand of the 'plant'.

## Single heat pump and single gas boiler

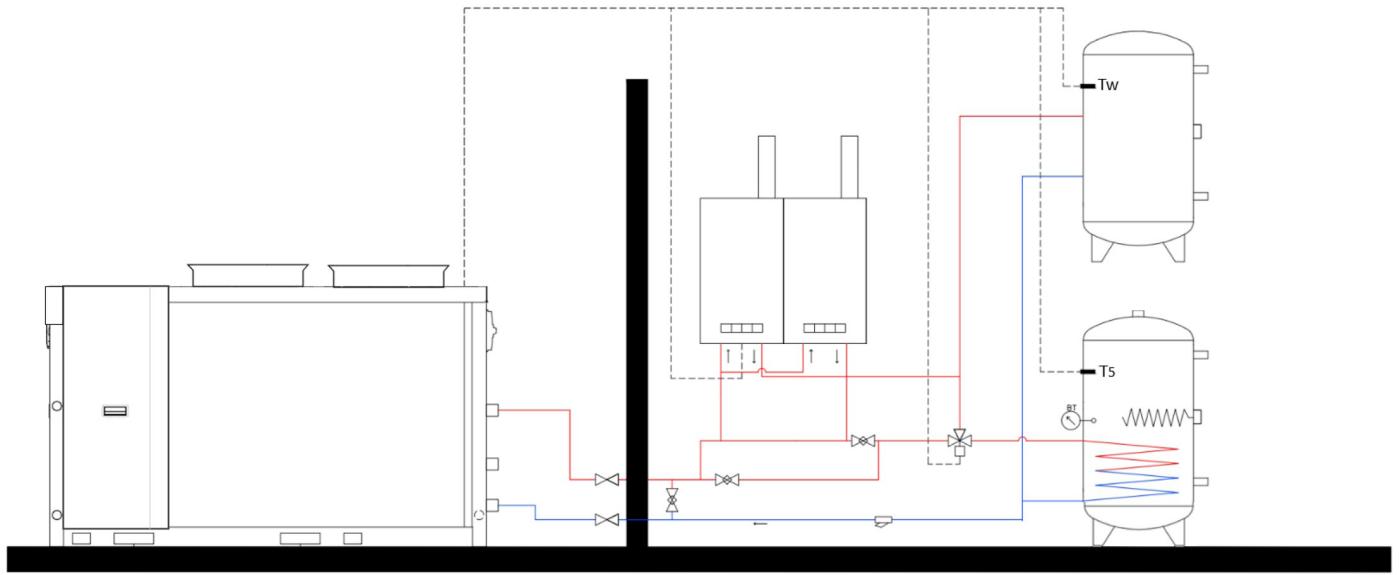

## System with cascade heat pumps and single gas boiler

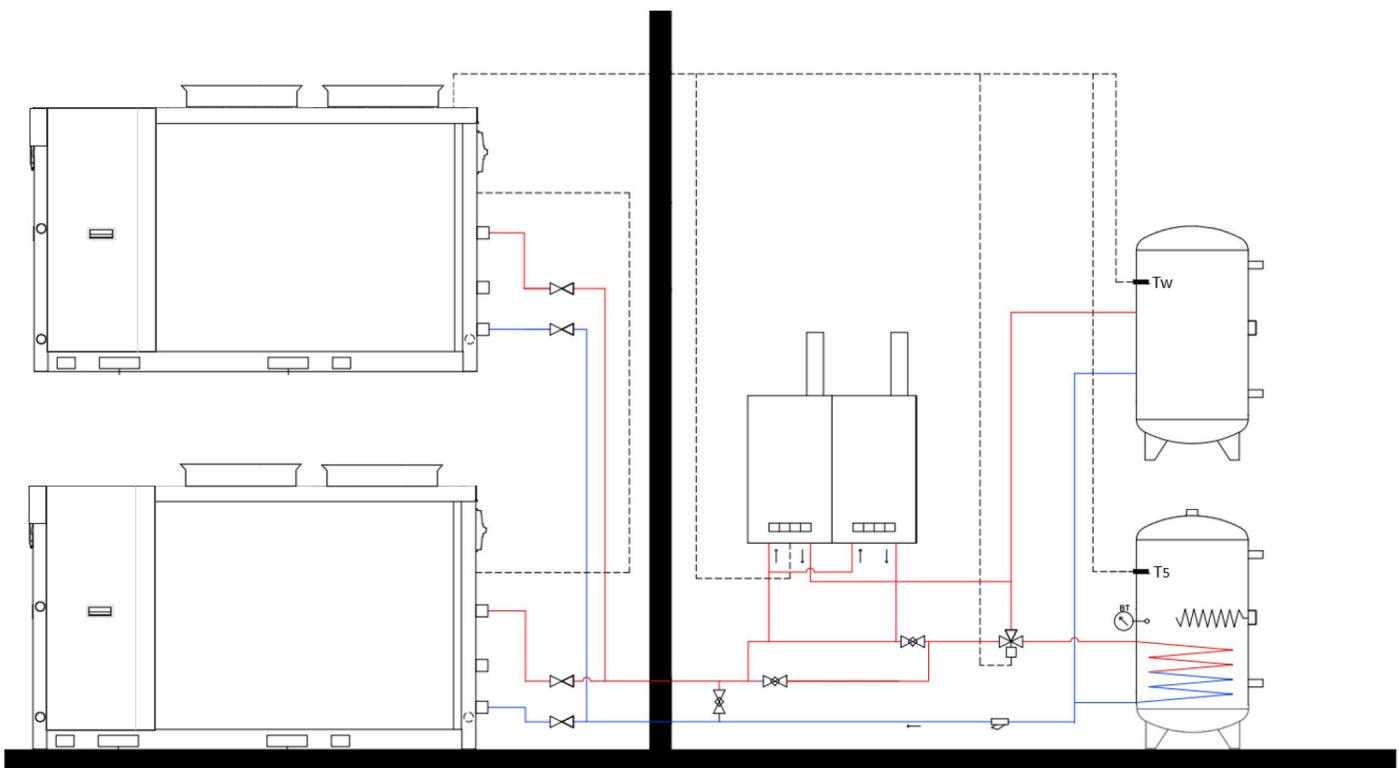

In a multi-zone configuration with one or more heat pump units in cascade, and Gas Boiler system in cascade, the auxiliary heat generator is activated when the heat pump or the heat pump cascade system in cascade is not sufficient to satisfy the plant request. When even the first auxiliary heat generator is not sufficient to satisfy the request, the second generator will also be activated for integration.
